Quality Broadcast Antenna Systems

**Directional FM Antenna
WRQV
Invisible Allies Ministries
Ridgway, PA**

A standard model PSIFML antenna with parasitic elements was used in conjunction with the customer's 3-1/2" diameter support mast to create the necessary directional radiation pattern. The final antenna consists of two radiating elements each secured to the mast with a standard mounting bracket. The antenna bays are half wave spaced and there are a total of two horizontal parasitic elements, one per bay. The antenna array is center fed and each radiating element receives equal power and phase.

Pattern testing was performed using a 1/3 scale model element and mast. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and mast under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and mounting structure were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753A-network analyzer operating at 264.3 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 93.3% of the envelope RMS.

The antenna is to be mounted 58 meters (190.2 ft.) +2/-4 meters above ground level on a the support mast above the tower top and positioned 300° True. No other antenna can be installed within 10 ft of any radiating element. Any guy wire that passes within 15 ft. of a radiating element must be changed to the appropriate non-metallic substitute. It is recommended that a broadcast engineer be present to supervise the installation of the antenna and that he or she certifies that the antenna has been installed according to the enclosed instructions.

An input power level of 2.06 kW will be required at the antenna input in order to reach the approved 2.1 kW ERP. The final length of LDF5-50A transmission line used to feed the antenna is 215 ft. The resulting transmitter output power is 2.45 kW.

Antenna Specifications

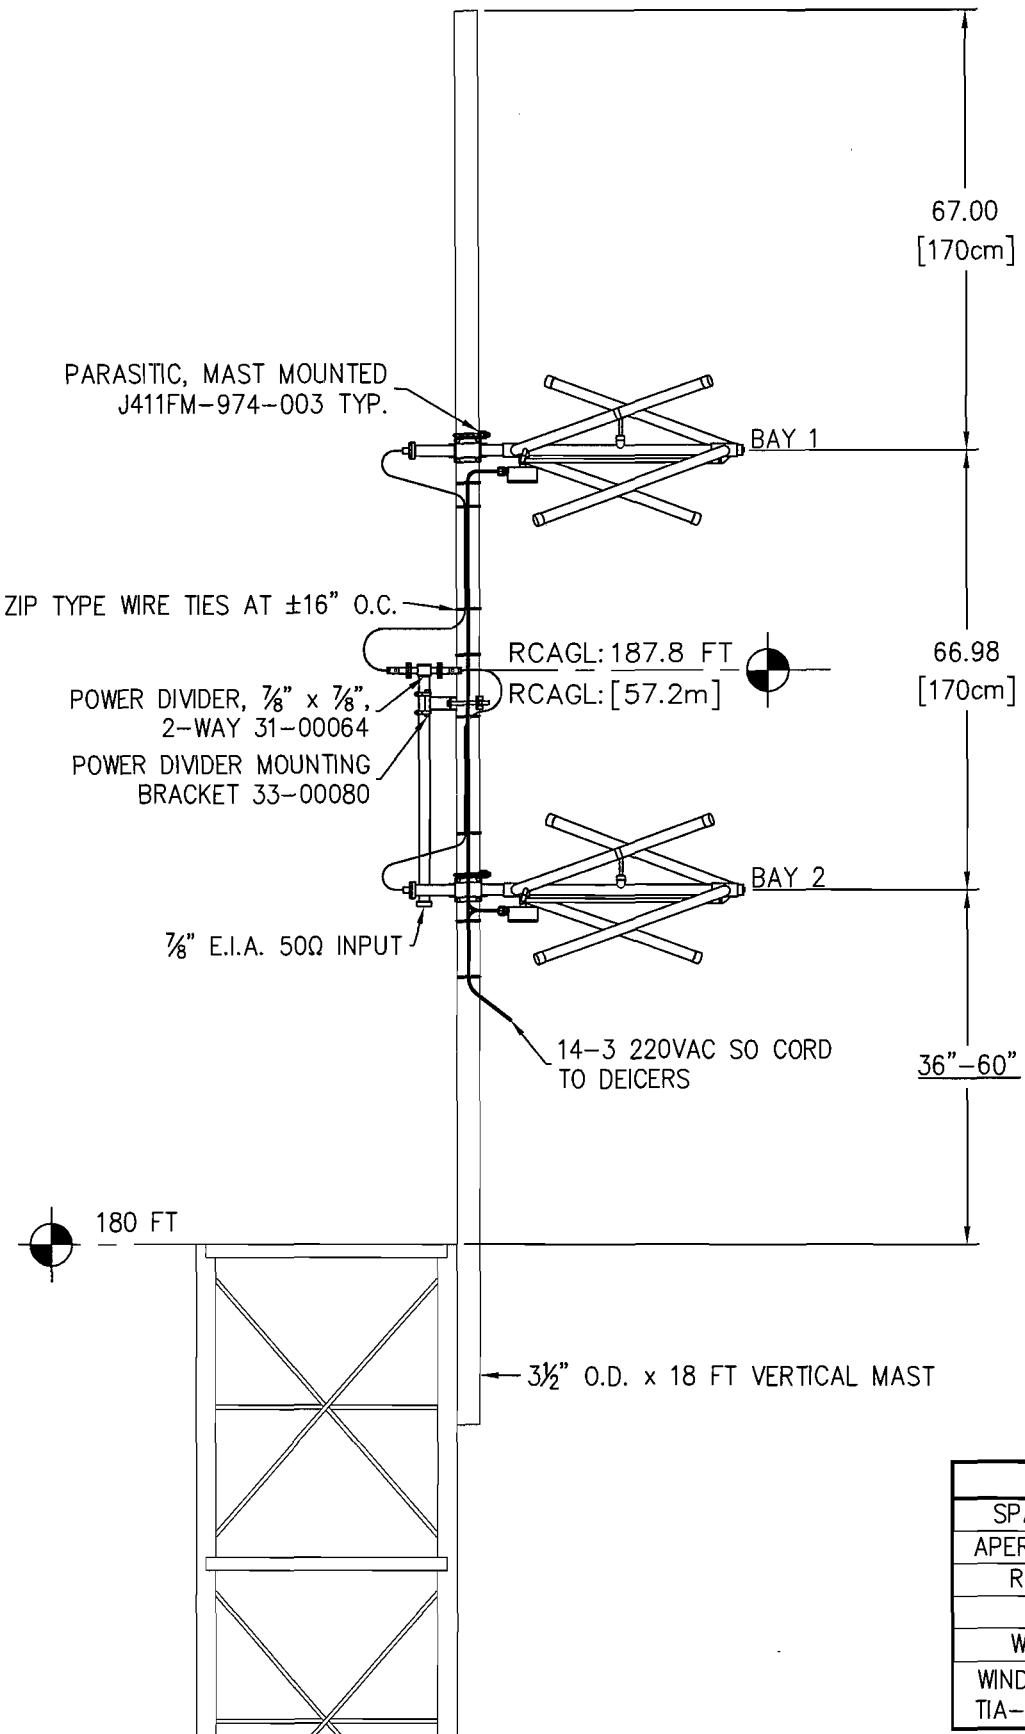

Antenna Model	PSIFML-2B-HWS-DA
Type	2-bay directional FM antenna
Bay Spacing	Half wave spaced elements
Frequency	88.1 MHz
Polarization	Circular
Envelope RMS	.912
Composite RMS	.851
Gain (h-pol)	1.02 (.09 dB)
Gain (v-pol)	1.02 (.09 dB)
ERP	2.1 kW
Antenna input power	2.06 kW
Transmission line	Andrew LDF5-50A (7/8" foam coaxial cable)
Line length	215 ft.
Line Efficiency	83.92%
Transmitter output power	2.45 kW
Input	7/8" EIA center fed input
Power rating	3 kW
Length	5.58 ft.
Weight	46 lbs.
Wind Area	4.4 sq. ft.

Statement of Certification

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.

Douglas A. Ross
President
Propagation Systems Inc.
