Quality Broadcast Antenna Systems

**Directional FM Antenna  
WVRS  
Timber Ridge Ministries  
Gore, VA**

A standard model PSIFML antenna with parasitic elements was used in conjunction with the customer's 32" face triangular tower to create the necessary directional radiation pattern. The final antenna consists of one radiating element secured to a custom support mast mounted to the northwest tower face. The antenna includes two vertical and one horizontal parasitic elements. The antenna has a Type "N" female input.

Pattern testing was performed using a 1/3 scale model element and tower. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and tower under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and mounting structure were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753E-network analyzer operating at 270.3 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 85.8% of the envelope RMS.

The antenna is to be mounted 35 meters (114 ft.) above ground level on the northwest face of the tower and positioned 300° True. At this elevation the antenna will be within the allowed +2m/-4m tolerance. No other antenna can be installed within 3 meters from the radiating element. Any guy wires that pass within 10 ft. of any radiating element must be replaced with a non-metallic substitute. It is recommended that a broadcast engineer be present to supervise the installation of the antenna and that he or she certifies that the antenna has been installed according to the enclosed instructions.

An input power level of .185 kW will be necessary at the antenna input in order to reach the required .250 kW ERP. The transmitter output power requirements are dependent upon the transmission line size and length used to feed the antenna. The final length of transmission line must be determined after installation.

## Antenna Specifications

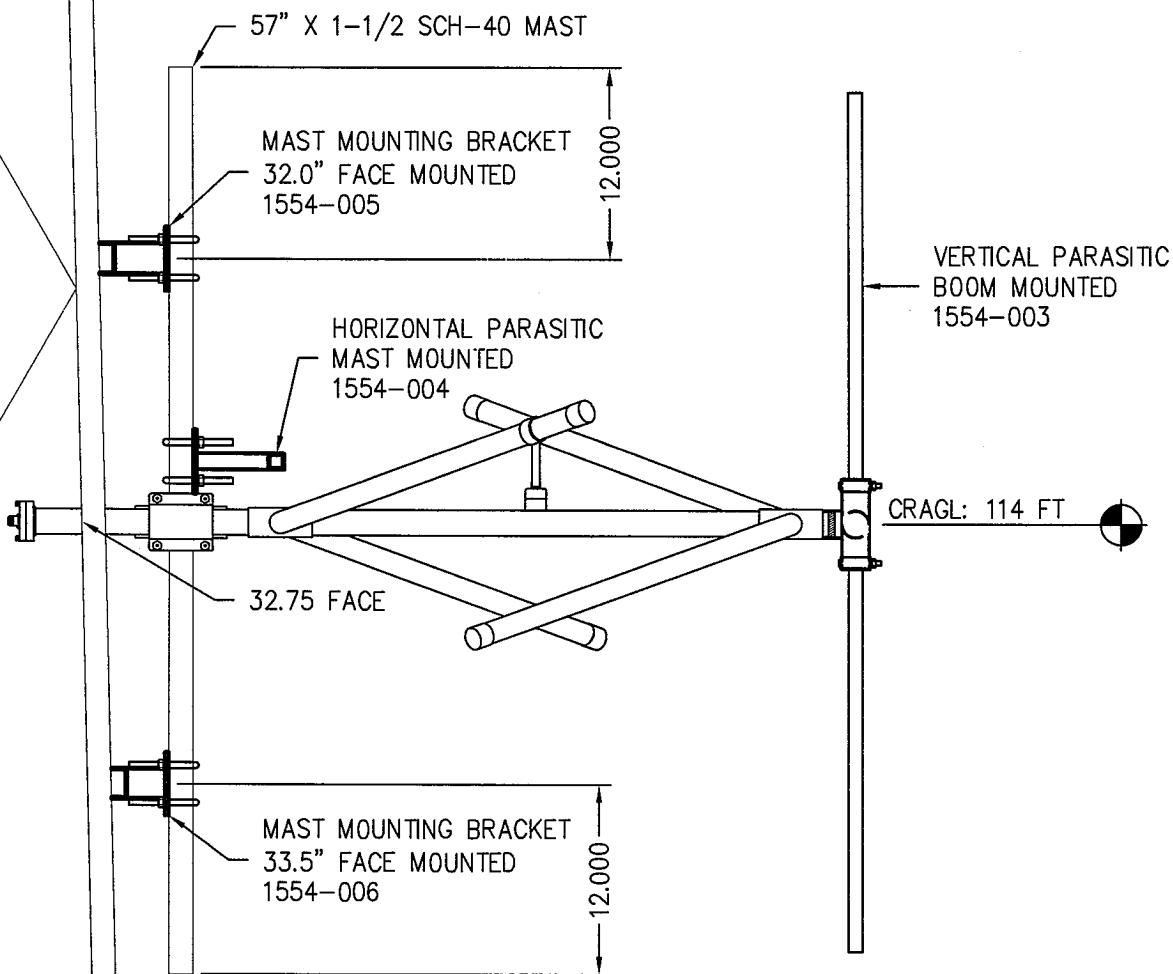

Antenna Model	PSIFML-1A-DA
Type	1-bay directional FM antenna
Frequency	90.1 MHz
Polarization	Circular
Envelope RMS	.671
Composite RMS	.576
Gain (h-pol)	1.35 (1.32 dB)
Gain (v-pol)	1.17 (.701dB)
ERP	.250 kW
Antenna input power	.185 kW
Input	Type "N" female
Power rating	.750 kW
Length	4.75 ft.
Weight	56.5 lbs.
Wind Area	5.43 sq. ft.

## Statement of Certification

This is to certify the antenna has been designed, fabricated and tested under my supervision and it meets the required envelope pattern limitations set forth in the stations construction permit.

 4/14/2016

Douglas A. Ross  
President  
Propagation Systems Inc.
