

## EXHIBIT #18 CONTOUR PROTECTION

**The University of Oklahoma**  
Minor Change to Licensed Station  
KGOU  
BLED-19830804AE  
Norman, OK

July 2007

CH 292A                                    6.0 kW H & V

As shown in the minimum spacings table found in Exhibit #15, KGOU meets all spacing requirements with the exception of first adjacent Class C3 station KTLS-FM, Holdenville. Section 73.215 of the FCC's rules allows for such short-spacing when the minimum distance of 72 kilometers between first adjacent Class A and C3 stations met and there is no contour overlap between each stations protected contour with the other station's interference contour. In cases where the potential interfering station is not classified as a 73.215 station, that station's facilities must be considered at full height and power for class when predicting distances to protected and interference contours.

KGOU proposes to provide contour protection under Section 73.215 to KTLS-FM, Holdenville. KTLS-FM is classified as a Section 73.215 station, operating with 25 kW from an antenna height above average terrain (HAAT) of 100 meters. Those parameters were considered in the attached studies.

Page #2 of this exhibit is a contour-to-contour protection study, showing that no overlap will be either caused or received to the existing facility of KTLS-FM by the proposed KGOU. A map and FMOVE table of that contour relationship can be found on pages 3-10.

Terrain database is NGDC 30 SEC

ERP and HAAT are on direct line to and from reference station.

Ant Column: (D= DA Standard, Z= DA 73.215, N= Not DA 73.215, \_= Omni), Polarization (C, H, V, E), Beamwidth(Y, N, X)

\*"affixed to 'IN' or 'OUT' values = site inside protected contour.

"«" = Station meets FCC minimum distance spacing for its class.

### HOW TO READ THE FM COMPUTER PRINT-OUT

The computer printout should be self-explanatory for the most part. The parameters of the station being checked, (reference station) are printed in the heading. The 60 dBu protected contour is predicted from the Commission's F(50-50) table, while the 40, 54, 80 and 100 dBu contours are interference contours derived from the Commission's F(50-10) table. Contour distances are in kilometers and are predicted using spline interpolation from data points identical to those published in Report No. RS 76-01 by Gary C. Kalagian. Critical contour distances are determined using the Commission's TVFMINT FORTRAN subroutine. When interference contour distances are less than 16 kilometers the F(50-50) tables are used. If signal contour distances are less than 1.6 km the free-space equation is used.

The column listed "**\* IN \***" is the sum of the reference station's 60 dBu protected contour and the data file station's interference contour subtracted from the distance between the stations. (All distances are derived by the method detailed in Sec. 73.208 of the Rules and Regulations as amended in Docket 80-90.) Therefore, the column is a measure of incoming interference. Negative distances in this column indicate the presence of interference. Listed antenna heights are the average heights of eight standard radials as found in the Commission's records unless otherwise noted, in which case the specific antenna heights and the DA power, if applicable, along the straight line azimuths between the reference station and the database station are used and visa versa. The column labeled "**\* OUT \***" shows the distance in kilometers of overlap or clearance between the reference station's interference contour and the database station's protected contour. Negative distance figures in this column indicate outgoing overlap interference.

Under the "AZIMUTH" column, the first row of numbers indicate the bearings from True North of the data base stations in relationship with the reference station, while the numbers in the second row indicate the reverse bearings from the database station to the reference station.

The columns labeled "INT" and "PRO" hold the distance in kilometers of the appropriate interference contour and the protected contour of a data base station.

For I.F. relationships the "IN" and "OUT" columns change their significance. The letter "R" stands for the minimum **required** distance in kilometers, while the letter "M" in the next column follows the **available clear space** separation in kilometers. Minimum separation distances when displayed are taken from Sec 73.207 of the rules as amended. Canadian and Mexican separation distances, U/D ratios and protected contour values are from the US/Mexican Working Agreement and the US/Canada Working Agreement".

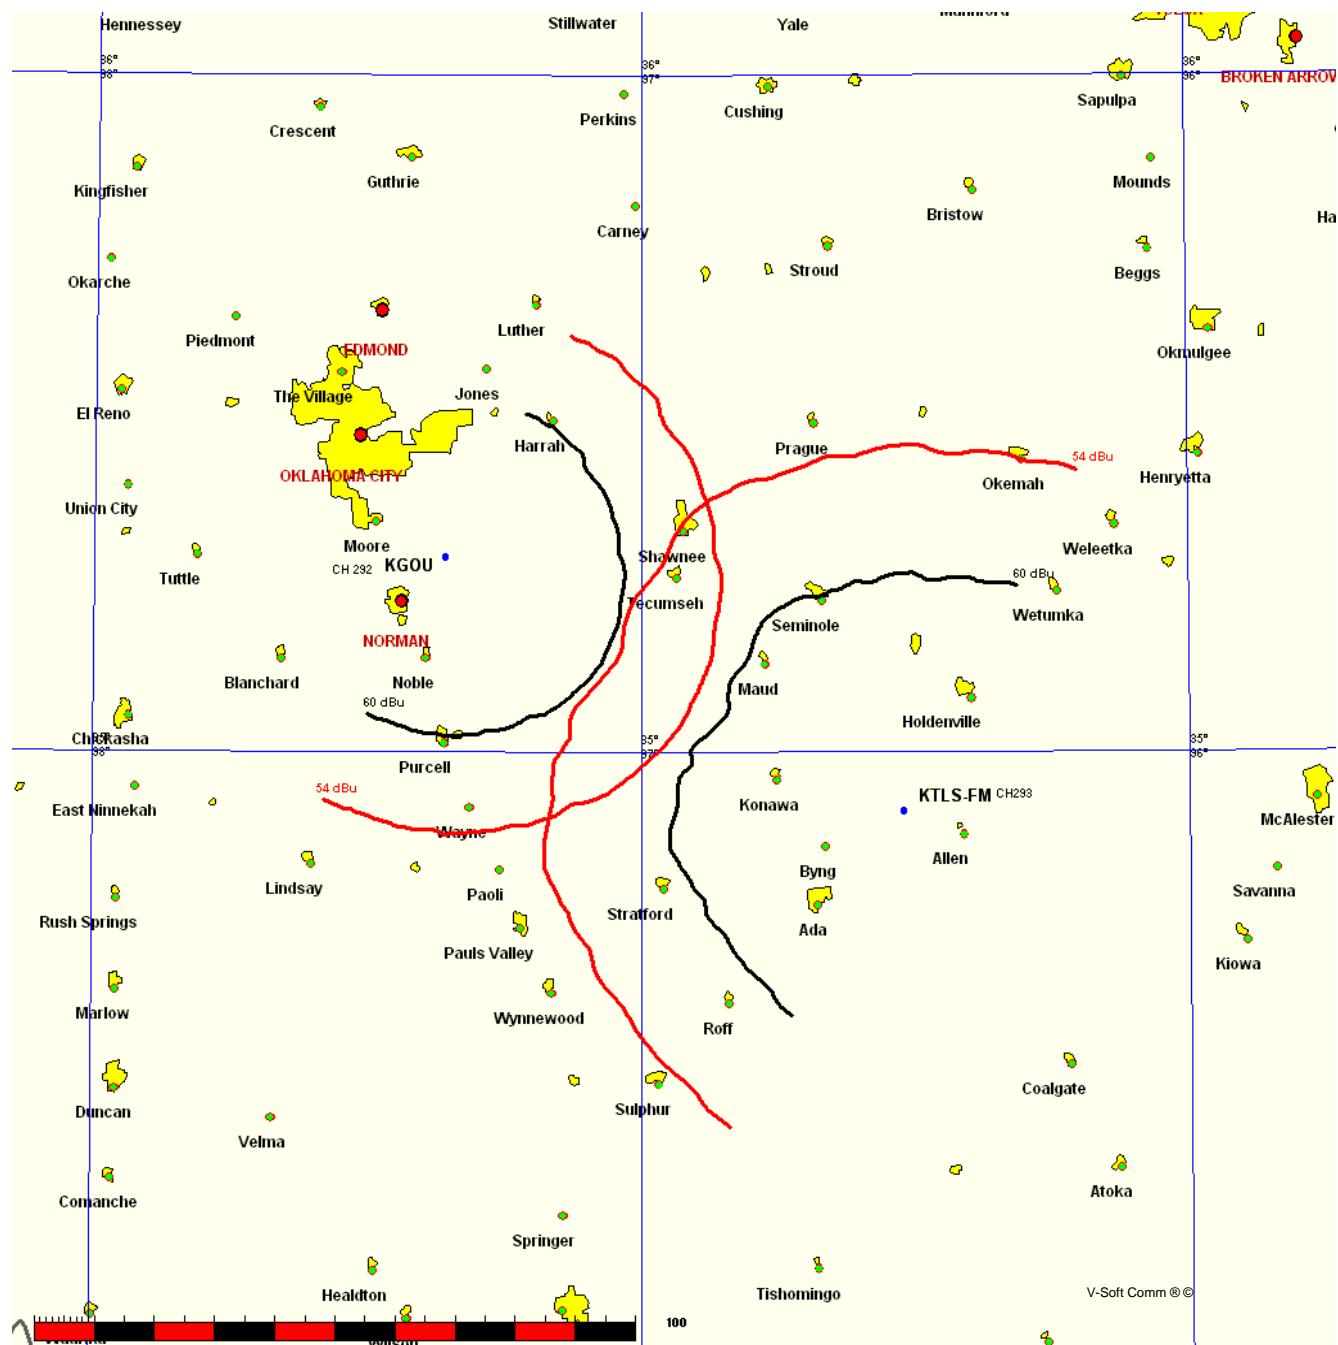

The first three letters of the "TYPE" column identify the current FCC status of the stations. The fourth letter will be a "D" if the facility is directional. "Z" indicates a 73.215 directional. An "N" indicates it is a 73.215 station that operates omni. The fifth letter will be an E, H or V depending on the type of antenna polarization. The sixth letter will be a "Y" if the antenna uses beam tilt or an "X" if the commission is not sure, otherwise it will be an "N".
