

SECTION 74.1204(d) STUDY

This narrative exhibit demonstrates that the predicted interference to the 54 dBu contours of the third-adjacent WHWK and second adjacent WAAL, Binghamton, NY is allowable under the rules stated in 47 CFR 74.1204(d).

In support thereof this Applicant states the following:

1. WHWK, Binghamton, NY and WAAL, Binghamton, NY third and second adjacent channel facilities to this translator proposal, are protected from interference within their 54 dBu contours from the associated interference contour (based on 47 CFR 74.1204(a)(1); using the FCC F(50/10) curves) which need be 40 dBu greater than the associated coverage contours (WHWK & WAAL) that would encompass the proposed translator antenna site and that contour which is 40 dBu greater than the associated coverage contour.

2. This translator's antenna location is located within the 54 dBu contour (based on 73.333 F(50/50)) of WHWK, Binghamton, NY, and within the 54 dBu contour (based on 73.333 F(50/50)) of WAAL, Binghamton, NY. This proposal will use the predicted desired to undesired coverage method to determine the appropriate interference contour that need be used with regard to WHWK & WAAL. Included as an attachment (W254BH Desired to Undesired Ratios Map) is a map showing that the 91 dBu coverage contours of WHWK and WAAL encompasses the proposed antenna site along with the entire proposed 131 dBu interference contour. As the proposed 131 dBu interference contour is 40 dBu greater than the 91 dBu contours of WHWK and WAAL then this contour is the appropriate interference contour for this analysis and it is clearly evident that interference will only occur within this interference contour for this proposed translator.

3. Given this translator's requested effective radiated power of 130 watts Directional; the predicted 131 dBu interference contour for this proposal would be small. At any HAAT value, the maximum 131 dBu contour distance for this proposal is 0.02 kilometers (20 meters) towards 164 degrees and smaller in all other directions.

4. This proposed translator antenna is to be situated 19 meters above ground on a 20 meter tall radio tower. Enclosed as W254BH Vertical Freespace CA2CP, is a study showing the free space signal distance based on the Freespace Equation and factoring in the Vertical Pattern (downward radiation) of the proposed CA2CP Antenna. Based on this study, no part of the 131 dBu contour ever reaches the ground level. As such, no interference would be caused at any location on the ground. The rule in 47 CFR 74.1204(d) states "an application otherwise precluded by this section will be accepted if it can be demonstrated that no actual interference will occur due to intervening terrain, lack of population or such factors as may be applicable." In this particular case, as shown in this exhibit, it is clearly evident that there is a "lack of population" as defined in 47 CFR 1204(d) thus allowing this translator to operate at this proposed location.

For the foregoing reasons this Applicant submits that the predicted interference to WHWK, Binghamton, NY and WAAL, Binghamton, NY is allowable under Section 74.1204(d) of the Commission's rules.

Furthermore, grant of this application is in the public interest as it would increase the coverage area of a radio facility in this area and impose no hardship to the referenced facilities, WHWK, Binghamton, NY and WAAL, Binghamton, NY.
