SPURIOUS EMISSIONS

Actual measurements at a location 1 kilometer from the KRSJ antenna show emissions between 120 kHz and 240 kHz removed from the carrier frequency to be 28 dB below the unmodulated carrier frequency, below the 25 dB required by the FCC in Part 73.317. Between 240 kHz and 600 kHz measurements show the emissions to be attenuated at 38 dB below the unmodulated carrier. At 600 kHz removed from the carrier, measurements show the emissions to be more than 80 dB attenuation.
