Quality Broadcast Antenna Systems

**Directional FM Antenna
Muskegon Community Radio Broadcast Company
WHEY
North Muskegon, MI
11-20-2008**

A standard model PSIFML antenna with parasitic elements was used in conjunction with the customer's tower to create the necessary directional radiation pattern. The final antenna consists of three radiating elements each secured to the southwest tower leg with a factory installed mounting bracket. The antenna bays are $.9\lambda$ spaced and there are a total of three horizontal parasitic elements. The antenna array is branch fed and utilizes a 3-way power divider and $\frac{1}{2}$ " coaxial transmission lines to distribute equal power and phase to each radiating element.

Pattern testing was performed using a 1/3 scale model element and tower. The azimuth plane measurements were taken on a ground reflection test range. This type of test range utilizes the reflected signal and direct signal from the source antenna to form an interference pattern on the antenna under test. The antenna and tower structure under test was mounted to a turntable that allowed the structure to be rotated 360° in the azimuth plane. The source antenna was located approximately 75 ft. from the antenna under test. The source height above ground was adjusted to peak the first lobe of the interference pattern at the antenna under test.

The test antenna was mounted in the center of rotation of the turntable. The antenna and mounting structure were rotated clockwise while data was recorded in a counter clockwise direction. All feed cables to the antenna were secured and grounded during pattern measurements. A Hewlett Packard 8753A-network analyzer operating at 266.7 MHz was used as both the source and receiver. The level of the received signal was compared with a standard dipole to establish the directivity of the final pattern. The final pattern measured does not exceed the envelope pattern and is 94% of the envelope RMS.

The antenna center of radiation approved in the construction permit is 41 meters above ground. With the antenna mounted to the tower as shown in drawing J908FM-717-001 rev A it will be within the +2/-4 meter tolerance allowed by the FCC. No other antenna can be installed within 10 ft of any radiating element. The antenna is to be positioned 290° True. It is recommended that a broadcast engineer be present to supervise the installation of the antenna and that he or she certifies the antenna has been installed according to the enclosed instructions.

An input power level of 555.6 watts will be required at the antenna input in order to reach the licensed 1.0 kW ERP. The transmitter output power will be 641.4 watts with 175 ft. of 7/8" coaxial transmission line as supplied.

Antenna Specifications

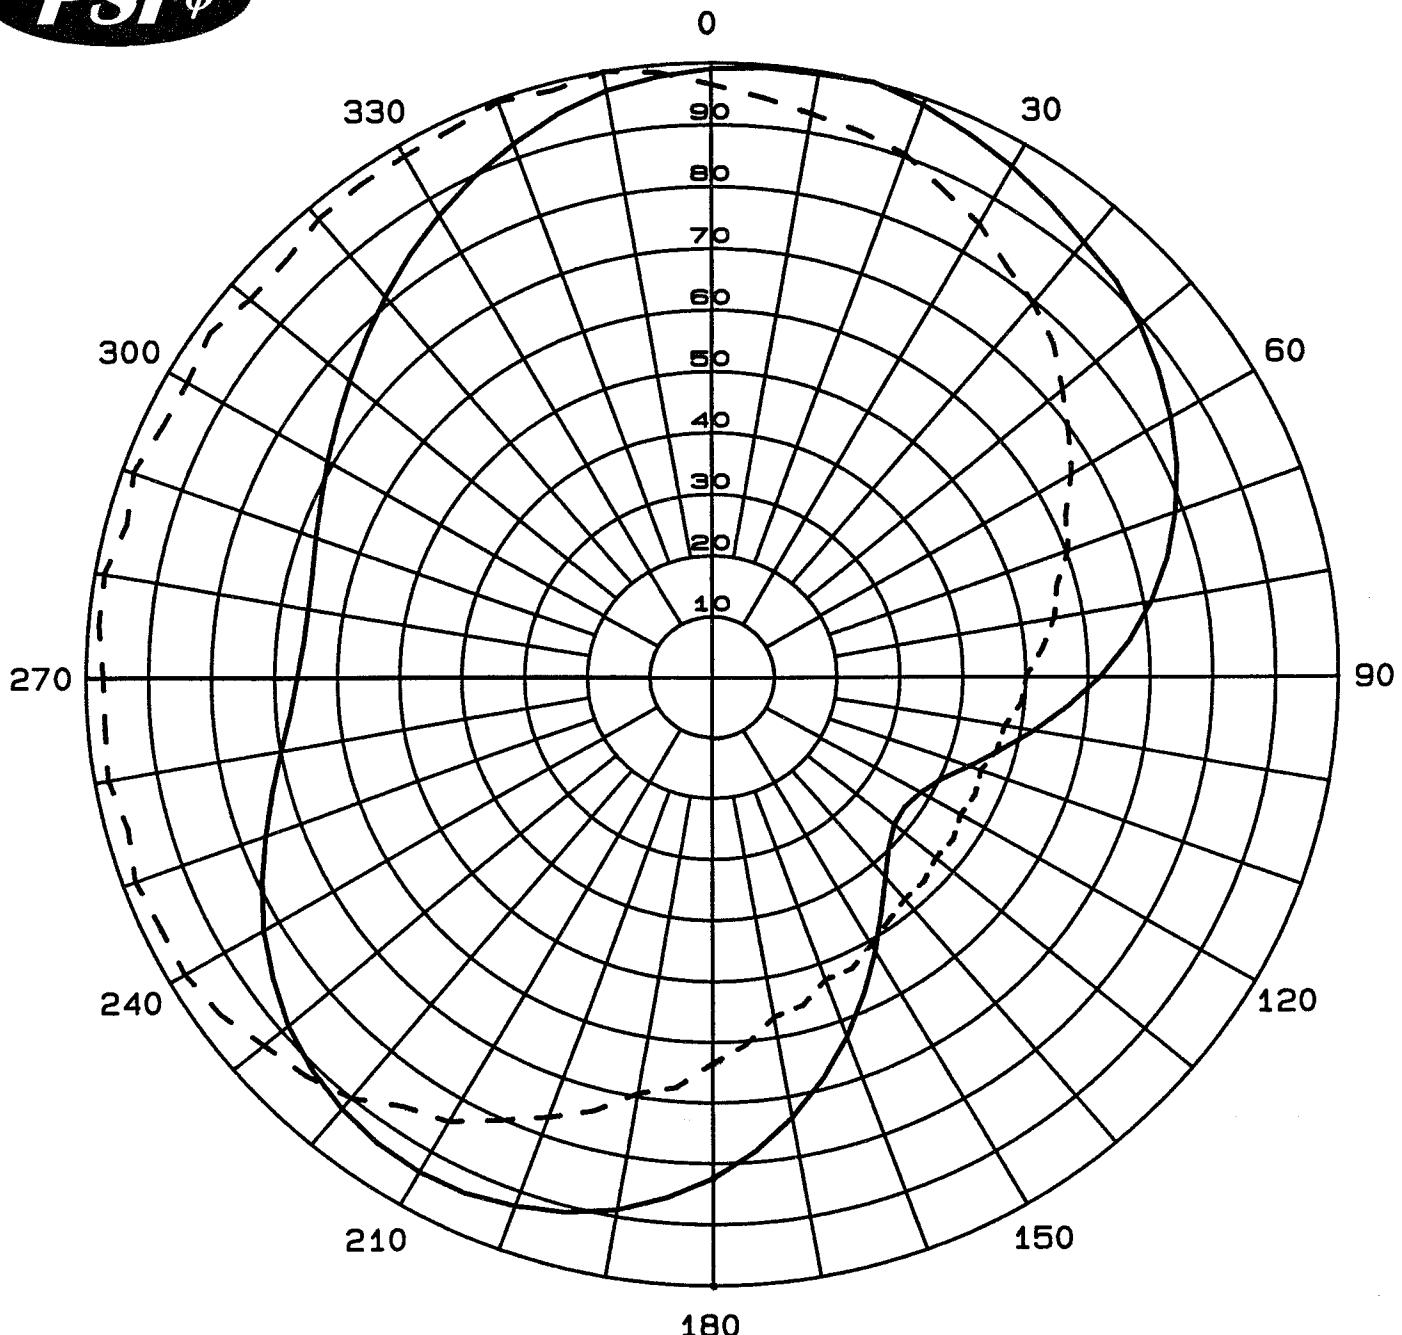

Antenna Model	PSIFML-3-DA
Type	3-bay .9λ spaced directional FM antenna
Frequency	88.9 MHz
Envelope RMS	.909
Composite RMS	.858
Gain (h-pol)	1.8 (2.55 dB)
RMS (h-pol)	.78
Gain (v-pol)	1.8 (2.55 dB)
RMS (v-pol)	.80
ERP	1.0 kW
Transmitter output	641.5 Watts
Transmission line	7/8' foam coaxial cable x 175 ft
Efficiency	86.6%
Power into antenna	555.6 Watts
Input	7/8" EIA center fed input
Power rating	1.5 kW
Length	19.9 ft.
Weight	178.1 lbs.
