September 17, 2003

In evaluating the proposed displacement for K17DD, an outgoing interference study was executed using the same tower location, but slightly different radiation pattern (as the existing K17DD license) and an ERP of 45.4 kW. The stations listed in the table below showed possible interference. When these stations were evaluated for outgoing interference using the OET-69 Longley Rice methodology. There was zero percent interference present found in each case.
