ENGINEERING TECHNICAL STATEMENT PREPARED BY WILLIAM T. GODFREY, JR. OF THE FIRM KESSLER AND GEHMAN ASSOCIATES, INC., TELECOMMUNICATIONS CONSULTING ENGINEERS IN CONNECTION WITH A MINOR CHANGE IN LICENSED FACILITY APPLICATION TO MAKE CHANGES TO THE GEORGIA PUBLIC TELECOMMUNICATIONS COMMISSION (“GPTC”) FM BROADCAST FACILITY, WACG-FM CHANNEL 214 C2, AUGUSTA, GEORGIA.

The firm Kessler and Gehman Associates, Inc., has been retained by the Georgia Public Telecommunications Commission (“GPTC”), Atlanta, Georgia, in order to prepare engineering studies and the engineering portion of a minor change in licensed facility application for the licensed WACG-FM Channel 214 C2 FM broadcast facility (BLED19890911KC) requesting authorization to correct coordinates and make changes to the following: 1) antenna system; 2) effective radiated power; 3) antenna height radiation center; and 4) polarization.

Discussion

The GPTC is licensed to operate WACG-FM Channel 214 C2 (BLED19890911KC) with an Effective Radiated Power (“ERP”) of 25 kW (horizontal and vertical polarization) at an antenna height radiation center of 83 meters Above Ground Level (“AGL”) using a nondirectional, side-mounted Jampro antenna. The proposed antenna is the former WJBF-TV Channel 6 General Electric model TY-60-F batwing antenna which is top-mounted on the same tower as the licensed WACG-FM Jampro antenna. The licensee of the WJBF-TV Channel 6 facility is Media General Broadcasting of South Carolina Holdings, Inc. (“Media General”). In order to support the new WJBF-DT Channel 42 antenna, Media General had to build a new 1,500-foot tower located approximately 0.36 km from its previous tower. Accordingly, WJBF abandoned its Channel 6 GE TY-60-F batwing antenna and began operating on a new Dielectric model TF-6BM Channel 6 antenna on the new tower.

Prior to abandoning the old site, the WLJK-FM Channel 206 C1 facility diplexed with the WJBF-TV Channel 6 facility using the same GE TY-60-F batwing antenna. Now that WJBF is

no longer using the old batwing antenna, the GPTC would like to take advantage of the vacancy by diplexing with the WLJK-FM Channel 206 facility using the same GE TY-60-F batwing antenna. This would serve the public well since the 975-foot antenna height increase would result in an increased coverage area with a 21.3 kW decrease in ERP (from 25 kW to only 3.7 kW). The power savings would be significant because the entire vertical component (ERP) would be eliminated since a batwing is a “horizontal only” type antenna. Another positive repercussion with respect to public interest is that the existing side-mount Jampro antenna would be used as an auxiliary antenna which is not currently in place for the WACG-FM facility. An FM auxiliary application was filed simultaneously with this application in order to expedite the proposed changes.

According to the Power and Antenna Height Requirements depicted in §73.211 of the FCC rules, the proposed 3.7 kW ERP (alone) would classify the proposed WACG-FM facility as a Class A station; however, the proposed antenna height radiation center above average terrain is 420.8 meters. Therefore, in accordance with §73.210 of the FCC rules, the proposed WACG-FM station would be a Class C2 facility based on the fact that the distance to the reference contour in all azimuthal directions would be greater than 39 km and less than or equal to 52 km (Exhibit 19). Based on the proposed WACG-FM facility’s ERP and antenna height above average terrain, the facility could not be classified using the maximum limits and minimum requirements in §73.211; therefore, the classification was determined using the procedures depicted in §73.210(b)(3).

Attached Figures

The following list is an index of enclosed figures produced by calculations and engineering studies of the proposed WACG-FM Channel 214 C2 facility.

- 1) Proposed Engineering Specifications (Exhibit 1).
- 2) Antenna Data (Exhibit 2).
- 3) Support Structure Profile/Elevation View of Antenna System (Exhibit 3).
- 4) Antenna Vertical Pattern: 0° - 11° (Exhibit 4)

- 5) Antenna Vertical Pattern: 0° - 90° (Exhibit 5)
- 6) Antenna Vertical Pattern Tabulation (Exhibit 6)
- 7) USGS 7.5-minute topographic quadrangle map depicting the proposed transmitter location and coordinate lines (Exhibit 7).
- 8) 1mV/m (60 dBuV/m) Predicted Contour and Radials, Proposed Transmitter Location, & Principal Community Boundary Depiction (Exhibit 8).
- 9) FM-to-FM Interference Studies (Exhibit 9).
- 10) FM Allocation Study - WYFH-FM (Exhibit 10)
- 11) FM Allocation Study - WUSC-FM (Exhibit 11)
- 12) FM Allocation Study - WFAE-FM (Exhibit 12)
- 13) FM Allocation Study – Composite (Exhibit 13)
- 14) TV Channel 6 Allocation Study (Exhibit 14).
- 15) Area Gained Contour Map (Exhibit 15).
- 16) Collocated ERP Table (Exhibit 16).
- 17) Distance between Sites Map (Exhibit 17).
- 18) Path Profile Map (Exhibit 18).
- 19) Distance to Contour Tabulation (Exhibit 19).
- 20) Vertical Pattern Comparison - Relative Field (Exhibit 20)
- 21) Vertical Pattern Comparison - dB (Exhibit 21)
- 22) TV Channel 6 Studies – 47 dBu to 68 dBu (Exhibit 22)
- 23) TV Channel 6 Studies – 69 dBu to 90 dBu (Exhibit 23)
- 24) Interference Area Map (Exhibit 24)
- 25) Longley-Rice interference Study (Exhibit 25)
- 26) Longley-Rice interference Population Report (Exhibit 26)

Transmitter Location

The licensed WACG-FM facility is currently operating on a 1,292-foot, Media General support structure with its antenna side-mounted at a 272-foot AGL radiation center height. The proposed batwing antenna is top-mounted on the same Media General support structure and has a 1,245.8-foot AGL radiation center height (Exhibit 3). The tower is registered with the FCC and has a

registration number of 1024410. The structure's address is 200 Pine Log Road, Beach Island, SC.

Allocation Studies

The F(50,50) 60.0 dBuV/m protected service contour for the proposed WACG-FM facility is depicted in Exhibit 8. It can be seen that the proposed facility's F(50,50) 60.0 dBuV/m service contour would completely encompass the entire community of Augusta, GA which is the designated principal community for the WACG-FM station.

Exhibit 9 is an FM-to-FM interference study which verifies that the proposed facility's F(50,10) interfering contours would not overlap any applicable station's F(50,50) 60.0 dBuV/m protected contours and that the proposed facility's F(50,50) 60.0 dBuV/m protected contour would not be overlapped by any applicable station's F(50,10) interfering contours.

Exhibit 10 is a pictorial depiction of the contour relationship between the proposed WACG-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10) 40.0 dBuV/m interfering (red) contours and the WYFH-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10) 40.0 dBuV/m interfering (red) contours. It can be seen that unacceptable overlap would not exist between the two stations.

Exhibit 11 is a pictorial depiction of the contour relationship between the proposed WACG-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10) 54.0 dBuV/m interfering (red) contours and the WUSC-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10) 54.0 dBuV/m interfering (red) contours. It can be seen that unacceptable overlap would not exist between the two stations.

Exhibit 12 is a pictorial depiction of the contour relationship between the proposed WACG-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10) 40.0 dBuV/m interfering (red) contours and the WFAE-FM facility's F(50,50) 60.0 dBuV/m protected (black) and F(50,10)

40.0 dBuV/m interfering (red) contours. It can be seen that unacceptable overlap would not exist between the two stations.

Exhibit 13 is a map depicting the protected and interfering contours over pertinent arcs, of all applicable stations, to demonstrate the absence of objectionable interference.

Exhibit 14 is a contour map depicting the WJBF-TV Channel 6 F(50,50) 47.0 dBuV/m protected Grade B contour and the associated F(50,10) 71.7 dBuV/m interfering contour for the proposed WACG-FM facility. It can be seen that the two sites are collocated.

Exhibit 15 depicts the licensed WACG-FM service contour (red) and the proposed service contour (blue). The green area between the two contours represents the increased coverage area that would serve the public with the proposed WACG-FM facility. It can be seen by referring to the map that the population gain would be 24,372 persons and the ERP reduction would be 21.3 kW.

Exhibit 16 is a table depicting the maximum ERP allowable for collocated non-commercial educational FM (“NCE-FM”) stations and the yellow highlighted cells show that a collocated NCE-FM Channel 214 facility could operate with a maximum ERP of 46.8 kW. Of course, the proposed WACG-FM facility could not operate with an ERP of 46.8 kW because it has been shown that the maximum ERP, without causing interference to another NCE-FM station, is 3.7 kW based on the proposed parameters.

The WACG-FM antenna and the new WJBF-TV Channel 6 antenna are not on the same support structure; however, Exhibit 17 demonstrates that the two sites are only 0.36 km apart and §73.525(d) of the FCC rules states that a NCE-FM station that is located 0.4 km or less from a TV Channel 6 station is considered collocated. Exhibit 17 is a path profile study which also demonstrates that the two sites are located only 0.36 km apart.

§73.525(d)(2) of the FCC rules states that a NCE-FM application must include a certification that the applicant has coordinated its antenna with the affected TV station by employing either

the same number of antenna bays with radiation centers separated by no more than 30 meters vertically or the FM vertical pattern would not exceed the TV vertical pattern by more than 2 dB. Exhibit 20 is a vertical pattern chart comparing the differences between the licensed WJBF-TV vertical pattern (blue) and the proposed WACG-FM vertical pattern (red). The two antennas are separated by more than 30 meters vertically; therefore, the intent of this exhibit is to demonstrate that the FM vertical pattern would not exceed the TV vertical pattern by 2 dB. Referring to Exhibit 20, it does not appear that the FM vertical pattern would exceed the TV vertical pattern by 2 dB; however, this exhibit was prepared using relative field data. Exhibit 21 compares the vertical patterns in dB and it can be seen that the FM vertical pattern would exceed the TV vertical pattern by more than 2 dB.

Exhibit 22 is a TV Channel 6 study depicting the WJBF-TV Channel 6 contours from the F(50,50) 47.0 dBuV/m contour to the F(50,50) 68.0 dBuV/m contour as well as the WACG-FM associated F(50,10) interfering contours. It can be seen that there are no intersections at any point.

Exhibit 23 is a TV Channel 6 study depicting the WJBF-TV Channel 6 contours from the F(50,50) 69.0 dBuV/m contour to the F(50,50) 90.0 dBuV/m contour as well as the WACG-FM associated F(50,10) interfering contours. Again, it can be seen that there are no intersections at any point.

The FCC rules state that in the cases where the predicted interference area to a TV Channel 6 station from a NCE-FM station is located within the F(50,50) contour of the TV Channel 6 station, the location of the FM interfering contour must be determined using the assumption that the Channel 6 field strength remains constant at 90 dBu everywhere within the 90 dBu TV contour. Exhibit 24 is a contour map depicting the licensed WJBF-TV Channel 6 F(50,50) 90.0 dBuV/m contour and the associated WACG-FM F(50,10) 91.3 dBuV/m interfering contour. It can be seen that the two contours do not overlap; however, the area inside the WACG-FM 91.3 dBuV/m interfering contour would be considered the interference area based on the fact that the WJBF-TV Channel 6 field strengths are to be considered constant at 90.0 dBu everywhere within its 90.0 dBu contour.

The method to calculate the predicted interference area and population is depicted in §73.525(e) of the FCC rules; however, this method is not required if a station meets the collocation criteria depicted in §73.525(d) of the FCC rules. The proposed WACG-FM facility meets the distance requirement to be considered a collocated station and the proposed antenna would employ the same number of bays (six) as the licensed WJBF-TV Channel 6 antenna; however, the WJBF-TV Channel 6 antenna height radiation center is 68.7 meters higher than proposed WACG-FM antenna height radiation center, which is greater than the 30-meter requirement. The proposed WACG-FM vertical pattern does not exceed the WJBF-TV Channel 6 vertical pattern by more than 2 dB except at 17°, 18°, 26°, 27°, 35° and 36° below the horizontal. This means that 0° through 16°, 19° through 25°, 28° through 34° and 37° through 90° are all within the 2 dB requirement. It is also important to recognize the following: 1) WJBF-TV Channel 6 ERP is 100 kW and the proposed WACG-FM ERP is only 3.7 kW; 2) the WJBF-TV Channel 6 antenna height radiation center is 448.7 meters AGL and the proposed WACG-FM antenna height radiation center is 380 meters AGL; 3) the WACG-FM facility operates on Channel 214 which is 13 channels above an 88.1 MHz FM facility which means it would be more likely to cause less, if any, interference; 4) the WJBF-TV Channel 6 antenna and the proposed WACG-FM antenna both have 6 bays; and 5) the WJBF-TV Channel 6 facility and the proposed WACG-FM facility are considered collocated. Based on the conditions stated above, it seems very likely that the proposed WACG-FM facility would cause zero percent (0.0%) interference to the licensed WJBF-TV Channel 6 facility.

Supplemental Showing

Therefore, GPTC respectfully requests authorization to make full use of terrain shielding and Longley-Rice terrain dependent propagation methods to demonstrate that the proposed WACG-FM Channel 214 facility would not cause interference to the licensed WJBF-TV Channel 6 station. Exhibit 25 depicts the Longley-Rice interference map which was prepared using the actual vertical patterns for the licensed WJBF-TV Channel 6 facility and the proposed WACG-FM Channel 214 facility. All cells predicted to receive interference within the licensed WJBF-TV Channel 6 F(50,50) 47.0 dBuV/m protected Grade B contour from the proposed WACG-FM Channel 214 facility would be depicted in red. It can be seen by referring to Exhibit 25 that that

the proposed WACG-FM Channel 214 facility is predicted to cause zero percent (0.0%) interference to the licensed WJBF-TV Channel 6 facility. Exhibit 26 is a Longley-Rice interference population report which further demonstrates that the proposed WACG-FM Channel 214 facility is predicted to cause zero percent (0.0%) interference to the licensed WJBF-TV Channel 6 facility.

In a Report & Order released August 22, 1997 (MM Docket 96-58 Para 68) the FCC stated that supplemental showings have been accepted for review in the context of a noncommercial educational FM station demonstrating compliance with the Channel 6 interference provisions of 47 C.F.R. Section 73.525.

The acceptance of this supplemental showing and grant of this application would benefit the public significantly by providing the listeners with a stronger, more robust signal due to the 974-foot antenna height radiation center increase which would eliminate terrain obstruction.

An operational auxiliary antenna would be in place for the first time and would allow continuous broadcasting to the public which is especially essential for times of emergency.

The existing WACG-FM 5-bay Jampro antenna does not have de-icing capability and the facility suffers downtime frequently due to heavy icing in that portion of the state.

The existing facility uses a 20 kW Continental transmitter which requires a hefty ten ton air-conditioning unit to keep it cool. The existing facility has experienced maintenance problems with the air-conditioning unit and it frequently experiences over temperature conditions in the summer months which also leads to downtime.

It should also be recognized that the proposed facility would directly result in savings to the public since the ERP would only be 3.7 kW instead of 25 kW which would reduce the transmitter output power from 20 kW to 0.61 kW. Additionally, the air conditioning expenses and maintenance would be significantly reduced since the proposed facility would operate with a low power, solid state transmitter.

Area and population Analysis

The population served by the proposed 1 mV/m contour (60.0 dBuV/m) was determined using 2000 U.S. Census data. The area and population within the proposed WACG-FM 1 mV/m contour is 7,253.59 sq km and 472,707 persons respectively. The area and population within the licensed WACG-FM 1 mV/m contour is 5,644.22 sq km and 448,335 persons respectively. This represents an area gain of 1,609.37 sq km and a population gain of 24,372 persons (Exhibit 15). The percentage change in area ($1,609.37/5,644.22$) is 28.5% and the percentage change in population ($24,372/448,335$) is 5.4%.

Intermediate Frequency Interference (53rd & 54th Adjacent Channels)

The proposed WACG-FM site would meet all separation requirements pertaining to intermediate frequency (“IF”) interference. The station with the narrowest gap with respect to distance from the proposed WACG-FM transmitter site is ($214 + 53 = \underline{267}$ & $214 + 54 = \underline{268}$) the licensed WWDM-FM Channel 267 Class C facility located approximately 128.86 km from the proposed WACG-FM transmitter site in Sumter, SC at North Latitude $34^{\circ} 03' 04''$ and West Longitude $80^{\circ} 40' 55''$ where a separation of 35 km is required; therefore, the distance is easily met with a margin of 93.9 km (Exhibit 9).

FM Blanketing Interference

Blanketing is defined as interference to the reception of other broadcast stations which is caused by the presence of an FM broadcast signal of 115 dBu (562 mV/m) or greater signal strength in the area adjacent to the antenna of the transmitting station. The 115 dBu contour is referred to as the blanketing contour and the area within this contour is referred to as the blanketing area. The proposed WACG-FM Channel 214 blanketing contour extends 0.76 km from its transmitter and it is understood that the GPTC must assume full financial responsibility for remedying new complaints of blanketing interference for a period of one year to all broadcast stations within the WACG-FM blanketing contour, including to the collocated WLJK-FM facility.

Environmental Impact

The proposed WACG-FM Channel 214 Class C2 facility would have no significant environmental impact as defined in §1.1307 of the FCC Rules. The FM transmitter, transmission line and antenna system would produce a maximum ERP of 3.7 kW (horizontal polarization). It was determined that the maximum lobe of radiation from the base of the tower out to approximately 2.16 miles would occur at approximately 868.3 feet from the base of the tower (1,513.8-foot radial distance from the antenna center). At approximately 868.3 feet from the base of the tower, the depression angle of the main lobe would be approximately 55.0° below the horizontal. At that point, the relative field is 0.280 and the power density six feet above the ground would be approximately 0.00005 mW/cm². This would only be 0.005% of the Maximum Permissible Exposure (“MPE”) limits for Occupational/Controlled Exposure and only 0.023% of the MPE limits for General Population/Uncontrolled Exposure authorized by the American National Standards Institute (“ANSI”).

Since operation of the proposed WACG-FM Channel 214 facility would not exceed 5.0% of the MPE limit for Occupational/Controlled Exposure or General Population/Uncontrolled Exposure at any point on the ground, the proposed WACG-FM facility would not be considered a “significant contributor” to the RF exposure environment pursuant to OET Bulletin 65, Edition 97-01. Therefore, contributions of exposure from other sources were not accounted for in this analysis. It is safe to conclude that the emissions would be insignificant and well within the maximum allowable requirements.

If other antennas are placed on the tower in the future, the applicant will cooperate with those users by reducing or completely terminating the power to the antenna when maintenance workers are in danger from electromagnetic radiation emanating from the antenna.

Certification

This technical statement was prepared by William T. Godfrey, Jr., Telecommunications Technical Consultant with Kessler and Gehman Associates, Inc. having offices in Gainesville,

Florida and has been working in the field of radio and television broadcast consulting since 1998. He graduated from the University of North Florida with a Bachelor of Arts degree in Criminal Justice and a minor in Mathematics in 1993. As a Professional in the field of Telecommunications he states under penalty of perjury that the information contained in this report is true and correct to the best of his knowledge and belief.

Interference Area Based on FCC Contours

Longley-Rice Interference Study from Proposed WACG-FM Facility to Licensed WJBF-TV Channel 6 Facility EXHIBIT 25

Inbound Interference From WACG-FM to WJBF-TV – Population report

D/U Ratio Study

Signal Resolution: 2.0 km

Study Date: 9-26-2005

Population Database: 2000 US Census (SF1,Housing)

Reference Station:

WJBF-TV (06+) Augusta, GA BLCT20040130AOR

100.0 kW - ND - 563 m AMSL

Settings:

Threshold for Reception: 47.0 dBu

Front-To-Back Ratio: 0.0 dB

Interfering:

Call Letters	City	State	Dist	Bear
WACG-FM (214)	Augusta	GA	0.4	260.3

D/U Ratio (dB)	Housing Units	Population	%
< 0.0	0	0	0.00
< -10.0	0	0	0.00
< -20.0	0	0	0.00

Coverage	471,671	1,118,866
----------	---------	-----------

D/U Ratio (dB)	Area (sq. km)	%
< 0.0	0.0	0.00
< -10.0	0.0	0.00
< -20.0	0.0	0.00

Coverage	1.0559276178531
----------	-----------------

"Coverage" indicates the area under study where the field strength is greater than 47.0 dBu.
