

TECHNICAL EXHIBIT
DIGITAL FLASH CUT APPLICATION
STATION K50IK (FACILITY ID 131205)
LINCOLN CITY, OREGON
CH 50 15 KW

Technical Narrative

This Technical Exhibit supports an application to “flash-cut” to digital operation for TV Translator station K50IK. Station K50IK is licensed to operate on analog channel 50 with a directional antenna maximum (visual) effective radiated power (ERP) of 23.3 kW and an antenna height above mean sea level (RCAMSL) of 332 meters.¹ K50IK is proposing to flash cut to digital at its current transmitter site.

Proposed Facilities

This application proposes to flash-cut to digital mode on channel 50 at the current transmitter site, using the current antenna. The site coordinates remain (NAD27): 44-45-23 N, 124-02-49 W.

Figure 1 is a map showing the licensed and proposed coverage contours. As is apparent on the map, the proposed 51 dBu digital contour will have some common contour overlap with the licensed 74 dBu contour.

¹ See BLTT-20040402ACM.

Allocation Considerations

A study has been conducted to assure that the proposal will not create prohibited interference with other licensed, authorized or pending analog or digital TV, LPTV/translator and Class A TV stations. Using the procedures outlined in the FCC's OET-69 Bulletin, and 2000 U.S. Census, the proposal complies with the current FCC policy (i.e., less than 0.5% new interference caused to other pertinent assignments). Figure 1 is the output of the OET-69 interference study.

The applicant recognizes the proposal is secondary to other authorized full-service analog and DTV operations. The applicant understands that it must correct and/or eliminate prohibited interference that may result from its proposed operation.

Radiofrequency Electromagnetic Field Exposure

The proposed K50IK facilities were evaluated in terms of potential radio frequency (RF) energy exposure at ground level to workers and the general public. The radiation center for the antenna is located 27 meters above ground level. The maximum proposed ERP is 15 kW. A relative field value of 0.25 was assumed for the Scala SL-8 antenna's downward radiation. The calculated power density at a point 2 meters (6.6 feet) above ground level is 0.04 mW/cm^2 . This is less than 10% of the FCC's recommended limit of 0.46 mW/cm^2 for channel 50 for an "uncontrolled" environment.

Access to the transmitting site will be restricted and appropriately marked with warning signs. In the event that workers or other authorized personnel enter restricted areas or climb the tower, appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down.

It is noted that this statement only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis will be or already have been provided to the FCC by the tower owner as part of the tower registration process.
