

ENVIRONMENTAL STATEMENT  
NEW FM TRANSLATOR, JONESTOWN, PA, CH. 284D  
MARY MEDICUS  
FCC FORM 349  
MARCH 2013

The applicant proposes mounting a new antenna on an existing 40 meter un-registered tower. The proposed Center of Radiation will be 36 meters Above Ground Level. The ERP will be 0.01 kilowatts (10 watts) watts with horizontal and vertical polarization. A one bay Nicom BKG 77 antenna is proposed. Calculations were made using FM Model for Windows, version 2.10. The proposed antenna Center of Radiation, above ground, was reduced by 2 meters to allow for the average height of a human on the ground. FM Model predicts a peak exposure of  $0.3475 \mu\text{w}/\text{cm}^2$  at a distance of 10 meters from the base of the tower. This represents 0.2 % of the allowable Maximum Permissible Exposure ("MPE") of  $200 \mu\text{w}/\text{cm}^2$  for uncontrolled environments at any point on the ground. Since the Nicom antenna is not specifically listed in the FM Model program, the worse case "Type 1" antenna was used for the study.

This site is also utilized by W296CD Jonestown, PA on channel 296D. It operates with 10 watts ERP. From FCC records, this station produces less than 0.2 % of the allowable, thus, even if directly added together, both K296CD and this new proposed translator would produce less than one percent of the total allowable peak exposure at any point on the ground. Both of these proposals operate with less than 100 watts ERP, this should be categorically excluded from Environmental processing.

The applicant will ensure that the public access to the tower is restricted by fencing, anti-climb devices or other appropriate measures. The site will be posted with RF warning signs. If climbing of the tower by authorized personnel becomes necessary,

transmitter power will be reduced to safe operating levels, or transmission even terminated, as necessary as not to exceed the RF exposure limits to tower workers. The licensee will cooperate with other users at the site with the scheduling of such tower or antenna maintenance.

No modification of the existing tower is proposed, other than the proposed side mounting of the antenna system and addition of a transmission line. The tower was constructed prior to March 16, 2001. The National Programmatic Agreement generally allows such a collocation without consultation or review under Section 106 and Subpart B of 36 CFR §800. The applicant believes that it is in full compliance with the Agreement, and that no further study is required.
