EXHIBIT 43
Environmental Statement

The applicant proposes to install a new DTV antenna at Cuesta Peak antenna farm, its licensed NTSC multi-user site. The proposed maximum ERP is 82.0 kW with a center of radiation 24 meters above ground level, but the location is not accessible by the general public. A preliminary analysis has been made of the potential human exposure to R-F radiation per O.E.T. Bulletin No. 65, using a series of points two meters above ground in the immediate area.

The analyses indicate that it is possible that the MPE for Occupational/ Controlled Exposure may be exceeded at various locations; however, the presence of such a large and varied number of R-F sources makes such calculations somewhat questionable. At the conclusion of installation, the applicant will authorize appropriate measurements to determine areas which would be marked and/or restricted in order to assure compliance with applicable MPE limits.
