

TECHNICAL EXHIBIT
DTV MAXIMIZATION APPLICATION
STATION WBIH(DT)
SELMA, ALABAMA
CH 29 1000 KW (MAX-DA) 408 M

Technical Narrative

This Technical Exhibit supports an application for digital television (DTV) station WBIH(DT) for its "maximized" DTV operation at Selma, Alabama. This application requests a construction permit (CP) for WBIH(DT) digital television operation on channel 29 at Selma with a directional effective radiated power of 1000 kilowatts. WBIH(DT) intends to reuse its authorized DTV construction permit facility directional transmitting antenna (Dielectric TFU-29JTT-RS360) for digital operation.

Proposed Facilities

Station WBIH(DT) proposes to operate DTV channel 29 from its authorized DTV facility. The antenna height above average terrain for the channel 29 DTV operation will be 408 meters. The proposed WBIH(DT) effective radiated power exceeds the Commission's *Appendix B* allocated maximum effective radiated power in some azimuthal directions for WBIH(DT).¹ Therefore, an allocation study was completed to ensure no prohibited interference would occur.

¹ See Seventh Report And Order And Eighth Further Notice Of Proposed Rule Making in the Matter of Advanced Television Systems and their Impact Upon the Existing Television Broadcast Service, MB Docket 87-268, Released August 6, 2007; Adopted August 1, 2007.

The proposed DTV transmitter site will be located atop the WBIH(DT) tower. Therefore, the proposed site location is:

32° 32' 26" North Latitude
86° 50' 33" West Longitude

A sketch of antenna and pertinent elevations are included as Figure 1.

The Appendix contains the vertical and horizontal plane radiation pattern for the proposed antenna system.

Figure 2 is a map showing the proposed DTV predicted coverage contour and the associated DTV appendix B Noise-Limited coverage contour. The extent of the contours have been calculated using the normal FCC prediction method.

Population Served

The herein proposed WBIH(DT) "maximized" facility is predicted to serve 625,385 persons, post-transition based upon the 2000 Census. WBIH(DT)'s associated Appendix B facility is predicted to serve 621,000 persons. Therefore, the herein proposed WBIH(DT) facility would serve more than 100% of WBIH(DT)'s Appendix B population.

Allocation Considerations

The proposed WBIH(DT) Channel 29 facility meets the requirements of Section 73.623 of the FCC Rules concerning

predicted interference to other Appendix B DTV allotments. Longley-Rice interference analyses were conducted pursuant to the requirements of the FCC Rules; OET Bulletin No. 69; and published FCC guidelines for preparation of such interference analyses. The Longley-Rice interference analyses were conducted using the software developed by du Treil, Lundin & Rackley, Inc. based on the FCC published software routines.² Stations selected for analysis were determined pursuant to the distance requirements outlined in the FCC DTV Processing Guidelines Public Notice. The results of the interference analyses for the proposed WBIH(DT) facility are summarized herein at Figure 3. As indicated therein, the proposed facility will meet the 0.5% criterion outlined in the FCC Rules and published guidelines with respect to all considered stations.³

Radiofrequency Electromagnetic Field Exposure

The proposed WBIH(DT) facilities were evaluated in terms of potential radiofrequency electromagnetic field exposure at ground level to workers and the general public. The radiation center for the proposed WBIH(DT) antenna is located 360 meters above ground level. The maximum effective radiated power is 1000. A "worst case" downward relative field value of 0.25 is assumed for the antenna's downward radiation. The calculated power density at a

2 The duTreil, Lundin & Rackley, Inc. DTV interference analysis program is based on the program and procedures outlined by the FCC in the Sixth Report and Order; subsequent Memorandum Opinion and Order; and FCC OET Bulletin No. 69. A nominal grid size resolution of 2 km was employed.

3 Interference analysis results reflect the net change in interference to a given station considering the interference predicted to occur from all other stations (i.e. "masking") including the allotment facility for WBIH(DT). This properly reflects the net interference change for determining compliance with the FCC 0.5% *de minimis* standard.

du Treil, Lundin & Rackley, Inc.

Consulting Engineers

Page 4

Selma, Alabama

point 2 meters above ground level is 0.016 mW/cm². This is less than 5 percent of the Commission's recommended limit of 0.38 mW/cm² for channel 29 for an "uncontrolled" environment.

Access to the transmitting site is restricted and appropriately marked with warning signs. In the event that workers or other authorized personnel enter restricted areas or climb the tower, appropriate measures will be taken to assure worker safety with respect to radio frequency radiation exposure. Such measures include reducing the average exposure by spreading out the work over a longer period of time, wearing "accepted" RFR protective clothing and/or RFR exposure monitors or scheduling work when the stations are at reduced power or shut down. The proposed WBIH(DT) operation appears to be otherwise categorically excluded from environmental processing.

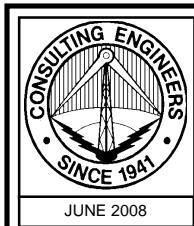

It is noted that this statement only addresses the potential for radiofrequency electromagnetic field exposure. All other aspects of the environmental processing analysis will be or already have been provided to the FCC by the tower owner.
