

Station KXST, North Las Vegas, NV, is licensed to operate on a frequency of 1140 kHz with directional patterns, 10 kW Day and 2.5 Kw Night.

CBS Radio Stations Inc, licensee of KXST is requesting Special Temporary Authority (STA) to operate with parameters at variance while maintaining monitor points within limits or with substantially adjusted computer modeled parameters.

A tower is being erected on the KXST property that may affect both day and night patterns. The tower will be used for FM Broadcast antennas and for a future AM array that will be diplexed with KXST.

Upon completion of new tower, KXST plans to perform computer modeling and sample system verification to establish operation of the KXST directional antenna consistent with the theoretical pattern using the newly adopted procedures described in Section 73.151 (c) of the Commissions Rules and Regulations.

KXST is requesting that the STA include provisions to operate KXST with the substantially adjusted day and night directional antenna systems, as described above, pending preparation and subsequent Commission processing of FCC Form 302-AM.
