

EXHIBIT 9

W209CJ  
MT. KISCO, NEW YORK  
TOWN OF MONROE, CONNECTICUT

On May 25, 2011 the existing transmit antenna for W209CJ was changed from a 1 bay Shively 6812 to a 2 bay half wave spaced Shively 6812.

W209CJ, as authorized in BLFT-20110420ABK, continues to operate at the same effective radiated power of 38 watts (for both horizontal and vertical polarization). The height of radiation center above ground remains the same at 23 meters (for both horizontal and vertical polarization). The height of radiation center above mean sea level remains the same at 166 meters (for both horizontal and vertical polarization). The overall height of antenna structure above ground remains the same at 23 meters.

The only change, other than antenna, is that the transmitter power output is now 0.097 kW.
