Human Exposure to RF Energy

The instant proposal will not cause the RF energy level in any publicly accessible area to exceed that set forth in the present ANSI guideline. The tower proposed herein was constructed under authority of BMP-20010213AAA as modified. All three towers that are a part of this existing antenna system are surrounded by chain link fences at distances of at least 3 meters, and are secured with locked gates. Signs have been posted at the site to warn of the potential to exposure to RF energy. WFI will ensure worker safety by implementing a comprehensive policy for work to be performed in the vicinity of the tower bases. That policy will include any steps necessary, including but not limited to, time restrictions in the tower base areas, use of measurement devices or reduction of power and/or ceasing operation of the transmitter during work periods
