

EXHIBIT 17, Subpart 1

RADIATION HAZARD FORMULA  
W275AB 102.9  
Elmira, NY

This proposal has been evaluated with respect to the RF radiation exposure guidelines contained in OET Bulletin 65. For the FM band, the power density may be computed from the formula:

$$S = \frac{(33.4) (F) (F) (P)}{(R) (R)}$$

where: S = Power Density

P = Total power in watts (Horizontal + Vertical)

R = Height of center of radiation in  
meters above ground minus 2

F = Relative field factor in the downward direction of  
interest (-60 to -90 degrees elevation) as supplied  
by the antenna manufacturer.

The antenna model is: Nicom BKG1/P

In this case P = 200 and R = 7 and F = 1

FCC General Population/

Uncontrolled Exposure limits permit up to 0.2 mW/sq cm exposure

at this frequency. Therefore at ground level, S = 0.13632653

mW/sq cm, or 68.16% of the allowable.

It is evident that no practical hazard should exist.
