

**Environmental Impact & RFR Compliance Statement**

The proposed minor modification of FM translator K216CJ will be located at an existing communications site that is in compliance with all requirements of Section 1.1307 of the Commission's rules.

The modification of K216CJ proposes to operate with .250 kW ERP, vertical, directional, with a COR AGL of 91.0 meters. There are currently no other broadcast facilities at the site.

For a worst case estimation, at 2 meters AGL at the base of the tower the RFR is .1% of the occupational/controlled MPE limit, and .5% of the general population/uncontrolled MPE limit.

RFR hazard warning signs will be posted at the site. The Applicant certifies that in cooperation with other users of the site, all authorized personnel will be protected from RFR exposure in excess of FCC guidelines while accessing any controlled exposure area, including the tower, by either reducing power or ceasing operations, and information pertaining to the contact representative of the facility will be posted.
