

## Attachment 11

### Unconditional Acceptance of and Non-Objection to Predicted Interference from and to Co-Owned Facilities, Pursuant to Section 74.703(a)

Pursuant to FCC Rule Section 74.703(a), The University of North Carolina (“UNCTV”) hereby consents unconditionally to any excess interference that might occur between or among the following TV Translator facilities as a result of the instant application and other applications filed contemporaneously with the instant application. All of the following facilities are owned and operated by UNCTV:

- **W19CR** (File No. BLTT-20031014ADV and its pending digital flash cut application, which includes a copy of this Unconditional Acceptance of and Non-Objection to Predicted Interference from and to Co-Owned Facilities, Pursuant to Section 74.703(a)).
- **W68DM** (File No. BLTT-20020502AAA and its pending application for channel displacement, which includes a copy of this Unconditional Acceptance of and Non-Objection to Predicted Interference from and to Co-Owned Facilities, Pursuant to Section 74.703(a)).
- **W28AN** (File No. BLTT-19900925IE and its pending application for a proposed companion channel filed during the June 19-30, 2006 LPTV companion channel filing window; if awarded to UNCTV, the final application for the companion channel will include a copy of this Unconditional Acceptance of and Non-Objection to Predicted Interference from and to Co-Owned Facilities, Pursuant to Section 74.703(a)).
- **W52BA** (File No. BLTT-19920623JC and its pending application for channel displacement, which includes a copy of this Unconditional Acceptance of and Non-Objection to Predicted Interference from and to Co-Owned Facilities, Pursuant to Section 74.703(a)).

As discussed in the technical exhibit to the instant application, Longley-Rice coverage studies show that interference between and among the above-referenced stations is likely in excess of the *de minimis* amounts allowed by Rule Section 74.793. Most of the interference in the stations’ area is predicted to occur on mountaintops, where the terrain is very rugged and where few viewers are located—most viewers are located well below the high mountaintops located between the various translator facilities. Each of these stations does not receive interference from all others but, in the aggregate, mutual interference is possible between some stations. The proposed interference is acceptable to UNCTV and the instant application does not cause prohibited interference within the principal service communities.
