Las Vegas, NV 89101

Dear Jonathan,

I performed the Radio Frequency Radiation (RFR) analysis using the information provided to me regarding K08NK and the existing FCC database information regarding any other transmitters located on that tower, specifically KIGN radio. The analysis was performed against the requirements outlined in the OET-65 document from the FCC website. The analysis using the combined percentages from the TV and radio broadcast facilities at that site resulted in a total of 13% (or .26  $\mu$ watts) of the allowable Maximum Exposure Limit (MPE) for general public exposure to RF radiation for these frequencies. These levels will not have significant impact on the quality of the human environment as outlined on the FCC application forms.

Sincerely,

Greg Best PE  
President
