FM Translator K245BV
Reno, NV Channel 245D
Allocation Study

The attached spacing study shows the spacing between the proposed translator site and the location of cochannel and adjacent channel stations and proposals. This study was made with the Commission's Class A spacing requirements, and individual situations were examined to determine the lack of prohibited contour overlap per the requirements of §74.1204 of the Rules. The attached allocation study map demonstrates compliance with the Commission's Rules for protection of FM broadcast stations and FM translators as outlined in §74.1204.

The proposed translator transmitter site is located within the 60 dBu protected contour of second-adjacent channel station KLCA 243C1 Tahoe City. The proposed site is 31.22 km from the KLCA transmitter site at a bearing of 14 degrees True. Given the KLCA antenna's 6.1 kW ERP and 951 meter HAAT along this radial, KLCA places a 78.6 dBu contour at the translator transmitter site. The corresponding interfering contour from the translator is $78.6 + 40 = 118.6$ dBu. The attached map of the proposed transmitter site depicts the 118.6 dBu contour from the proposed facility, which extends at most 130 meters from the antenna per a Free Space calculation. There are no occupied structures or major highways within that radius, as is depicted on the attached map of the proposed transmitter site. There is no population within this contour. Therefore, the proposed facility is believed to satisfy the requirements of §74.1204(d) with respect to KLCA.

The proposed translator transmitter site is located within the 60 dBu protected contour of second-adjacent channel station KOLC 247C Carson City. The proposed site is 37.21 km from the KOLC transmitter site at a bearing of 348 degrees True. Given the KOLC antenna's 619 meter HAAT and 87 kW ERP along this radial, KOLC places an 83.2 dBu contour at the translator transmitter site. The corresponding interfering contour from the translator is $83.2 + 40 = 123.2$ dBu. The attached map of the proposed transmitter site depicts the 123.2 dBu contour from the proposed facility, which extends at most 77 meters from the antenna per a Free Space calculation. There are no occupied structures or major highways within that radius, as is depicted on the attached map of the proposed transmitter site. There is no population within this contour. Therefore, the proposed facility is believed to satisfy the requirements of §74.1204(d) with respect to KOLC.

The attached spacing study demonstrates compliance with §73.207 of the Commission's Rules regarding spacing restrictions to stations which are 53 or 54 channels removed from the proposed operation.

FM Translator K245BV
Reno, NV Channel 245D
RF Exposure Study

Facilities Proposed

The proposed operation will be on Channel 245D (96.9 MHz) with an effective radiated power of 250 watts. Operation is proposed from an existing antenna which is mounted on an existing tower on Red Peak. Combined operation is proposed with FM translators K241AK, K285EQ and K223AL.

The proposed antenna support structure will not exceed 60.96 meters (200 feet) above ground and does not require notification to the Federal Aviation Administration. Therefore, this structure does not require an Antenna Structure Registration Number.

RF Exposure Calculations

The power density calculations shown below were made using the techniques outlined in OET Bulletin No. 65. "Ground level" calculations in this report have been made at a reference height of 2 meters above ground to provide a worst-case estimate of exposure for persons standing on the ground in the vicinity of the tower. The equation shown below was used to calculate the ground level power density figures from each antenna.

$$S(\mu W / cm^2) = \frac{33.40981 \times AdjERP(Watts)}{D^2}$$

Where: *AdjERP(Watts)* is the maximum lobe effective radiated power times the element pattern factor times the array pattern factor.

D is the distance in meters from the center of radiation to the calculation point.

Ground level power densities have been calculated for locations extending from the base of the tower to a distance of 1000 meters. Values past this point are increasingly negligible.

Calculations of the power density produced by the proposed K245BV antenna system assume a Type 1 element pattern, which is the appropriate element pattern for the Kathrein dipole antenna array proposed for use. The highest calculated ground level power density occurs at a distance of 6 meters from the base of the antenna support structure. At this point the power density is calculated to be 1.4 $\mu W/cm^2$, which is 0.7% of 200 $\mu W/cm^2$ (the FCC standard for uncontrolled environments).

These calculations show that the maximum calculated power density produced at two meters above ground level by the proposed operation of K245BV alone is less than 5% of the applicable FCC exposure limit at all locations between 1 and 1000 meters from the base of the antenna support structure. Section 1.1307(b)(3) of the Commission's Rules excludes applications for new facilities or modifications to existing facilities from the requirement of preparing an environmental

assessment when the calculated emissions from the applicants proposed facility are predicted to be less than 5% of the applicable FCC exposure limit. Therefore, the proposed facility is in compliance with Section 1.1301 *et seq* and no further analysis of RF exposure at this site is required in this application.

The permittee/licensee in coordination with other users of the site must reduce power or cease operation as necessary to protect persons having access to the site, tower or antenna from radiofrequency radiation in excess of FCC guidelines.

Ground-Level RF Exposure

OET FMModel

K245BV Reno

Antenna Type: Kathrein 762 943 2-bay dipole array
No. of Elements: 2
Element Spacing: 0.68 wavelength (2.1 meter spacing between bays)

Distance: 1000 meters
Horizontal ERP: zero kW
Vertical ERP: 0.250 kW

Antenna Height: 40 meters AGL

Maximum Calculated Power Density is 1.4 $\mu\text{W}/\text{cm}^2$ at 6 meters from the antenna structure.
