

# *APPLICATION FOR CONSTRUCTION PERMIT*

---

PROPOSED NEW FM TRANSLATOR STATION  
QUINCY, ILLINOIS  
FACILITY ID: 138447  
94.9 MHz / 0.027 kW ERP / ND

COMMUNITY BROADCASTING, INC.

JUNE, 2013

## **APPLICATION FOR CONSTRUCTION PERMIT**

The following engineering statement and attached exhibits have been prepared for **Community Broadcasting, Inc.** ("CBI"), applicant for a new FM translator station to serve Quincy, Illinois, and are in support of their application for construction permit.<sup>1</sup>

This application is being filed as the long-form application for the short-form engineering proposal submitted by CBI during the Commission's 2003 Translator Auction 83 window. The original short-form proposal was assigned FCC File No. BNPFT-20030312AUS. Upon initial review of the proposal, the Staff determined that the CBI proposal was mutually exclusive with several other applications. During the 2013 settlement window, CBI submitted an amendment to the original short-form proposal, which eliminated the mutual exclusivities. The technical parameters proposed under this long-form application are identical to those proposed under the recent settlement amendment.

The proposed facility would operate on channel 235 with a maximum effective radiated power of 27 Watts at a center of radiation of 228.2 meters AMSL. At this height, the center of radiation would be 85.7 meters above average terrain. The average terrain is defined by the 330 degree true radial, on which the average terrain is 142.5 meters AMSL. The average terrain on this radial was determined through the application of the NGDC 30-second linearly interpolated terrain database. The translator would not be a fill-in translator as the 60 dBu contour of the translator would lie outside the 60 dBu service contour of KSIV-FM, the primary facility. The proposed effective radiated power is consistent with the table in Section 74.1235. Exhibit E-1

---

<sup>1</sup> The Facility ID for NEW at Quincy, Illinois is 138447.

jeremyruck.com

illustrates the 60 dBu service contour of the proposed translator along with the 60 dBu service contour of the primary facility.

The proposed facility would not preclude LPFM licensing opportunities in any of the Appendix A markets. The two closest Appendix A markets to the proposed facility are the St. Louis and Quad Cities markets. Exhibit E-2 illustrates the site location relative to these two markets. As this map demonstrates, the proposed site location is outside the grid buffer of both.

The proposed facility would comply with the interference protection requirements of Section 74.1204 of the Commission's Rules. Exhibit E-3 is a tabular allocation study for the proposed facility. As this study demonstrates, the proposed facility would meet all contour overlap requirements to all proposed and authorized facilities with the exception of KOKX-FM at Keokuk, Iowa.<sup>2</sup> Exhibit E-4 illustrates this study in graphical contour form.

Although normally prohibited contour overlap between the proposed facility and KOKX-FM at Keokuk, Iowa would occur, there is no actual interference predicted to occur to any populated areas. Exhibit E-5 illustrates the location of the proposed site along with the 68.1 dBu F(50,50) service contour of KOKX-FM.

Interference to KOKX-FM would be predicted to occur when the field strength from the translator is at least 40 dBu above the field strength of KOKX-FM. The field strength at which interference to KOKX-FM would occur is therefore 108.1 dBu.

---

<sup>2</sup> The Facility ID for KOKX-FM at Keokuk, Iowa is 70573.

JEREMY RUCK & ASSOCIATES, INC.

P.O. Box 415

Fax: 855.332.9537  
jeremyruck.com

The power density for the proposed facility at a field strength of 108.1 dBu is given by the following equation:

$$S = \frac{E^2}{Z_0} = \frac{(0.25119)^2}{377} = 0.0001674$$

In this equation, S represents the calculated power density in Watts per square meter, E is the electric field intensity, which for 108.1 dBu is 0.25119 Volts per meter, and  $Z_0$  is the characteristic impedance of free space of 377 ohms.

The power density is also given by:

$$S = \frac{P}{4\pi R^2}$$

Where S is the same units, P is the power in Watts (27 Watts in this case), and R is the distance from the antenna. Rearranging the terms in the equation, it can be solved for the distance to the desired power density as follows:

$$R^2 = \frac{P}{4\pi S}$$

The results of these calculations for depression angles of 0 degrees to 90 degrees are tabulated in Exhibit E-6. The data in this exhibit is based on the use of a non-directional antenna. In addition to the tabular data in Exhibit E-6, several graphs are included, which graphically illustrate the interference situation for a given azimuth slice. As indicated on the form pages, a Shively model 6812B-2 antenna is proposed for use by the facility. The relative field value listed at the various depression angles is based on the published data for this antenna, and was obtained from the Shively web page.

JEREMY RUCK & ASSOCIATES, INC.

P.O. Box 415  
221 S. 1st Avenue  
Canton, IL 61520

Tel: 309.647.1200  
Fax: 855.332.9537  
jeremyruck.com

The resulting radii values indicate the volume in which interference is potentially predicted to occur relative to the center of radiation of the antenna. As the values and tables indicate, this interference area is confined to a volume located greater than 6.5 meters above ground level.

The satellite image above illustrates the location of the proposed tower site along with the buildings and structures in the vicinity. The next image is a street level shot of the structure and the surrounding area. From these two images, it can be reasonably inferred that there are no populated areas at 6.5 meters or higher above ground level in the immediate vicinity of the structure.

Fax: 855.332.9537  
jeremyruck.com

**8.27.2013**

The proposed facility would not result in a significant environmental impact, and is exempt from environmental processing. The addition of the translator antenna would not increase the existing environmental impact already present from the structure. In addition, the translator would not constitute an RF exposure hazard to the general public. The Commission's *FM Model* software package predicts a maximum power density of  $0.16 \mu\text{W}/\text{cm}^2$  at a distance of 24 meters.

CBI certifies that it will coordinate with all other users of the site to ensure that workers and other personnel having access to the site are protected from levels of radiofrequency radiation in excess of the applicable safety standards. Such coordination will include, but is not necessarily limited to, a reduction in transmitter power or cessation of operation.
