BECKLEY, WEST VIRGINIA
April 2010

EXHIBIT C

The proposed operation of W264BM on Channel 228 with an effective radiated power of 0.250 kilowatt at 120.4 meters above ground level will not cause interference to any existing, applied for, or proposed facility, as noted on Exhibit C1. However, the proposed W264BM site is inside the 60 dBu contour of third adjacent station WAXS, Channel 231B, Oak Hill, West Virginia.¹ Due to the relationship between W264BM on Channel 228D and WAXS, a 40 dB ratio of the protected and interfering contours applies. As the signal level of WAXS is well above 54 dB at the proposed tower site for W264BM, we have applied the 40 dB ratio to the contour of WAXS, based on the relevant protected contour at the site. A map showing the relative contour of WAXS at the proposed W264BM site is attached as Exhibit C2.

The signal of WAXS at the proposed W264BM site is 72.65 dBu (50/50). As such, the interfering contour of the proposed translator would need to be above 112.65 dBu (50/10) to cause interference to WAXS. The 112.65 dBu contour of the proposed W264BM translator extends 0.26 kilometer (2,210.0 feet) from the proposed translator antenna. The proposed W264BM antenna system is a Shively Labs ("Shively) Model 6812-2, two bay low power, full wavelength spaced antenna. Shively has provided the vertical elevation pattern of the antenna

1) Principals of SCC have an attributable interest in the licensee of WAXS.

system, so that calculations of the actual power level at depression angles between 5° and 90° could be calculated (Exhibit C3). Applying the actual relative field values, it was then possible to calculate, using a free space calculation, the actual distance to the interfering contour (F50/10) of the translator with respect to the WAXS facility.

As indicated in Exhibit C4, we have calculated the elevation above the ground of the interference from the proposed W264BM translator. The closest point above the ground that the interfering contour reaches is 15.6 meters (51.2 feet). This point occurs at a distance of 60.5 meters (199 feet) out from the base of the tower. There are no multi-story buildings or elevated roadways which would penetrate the 15.6 meter height of the interference zone, as indicated on Exhibit C5. Therefore, the interfering contour does not reach the ground and will not impact reception of service from WAXS. Thus, the interference is considered to be over an unpopulated area. As such, it is believed that the proposed W264BM facility is in compliance with §74.1204(d) of the Commission's rules. If a waiver of the rule is needed, one is respectfully requested.
