

# **EXHIBIT 15**

## **Boise, ID BPED-19931207MD**

### **Contour Overlap Requirements**

The allocation tabulation for the proposed station is reported on the following pages. A complete explanation of how to read the printout is shown on the page after that. Summarizing the explanation, each pair of lines represents an existing or proposed full service station. Entries which have a negative number in the columns marked **IN** or **OUT** could cause interference with the proposed station. At the bottom of the report the distance to the nearest TV-6 station is reported. For clarity, the groups are discussed in the order they first appear on the tabulation.

#### **Noncommercial Educational Stations and Applications**

All the stations/applications listed are clear of prohibited contour overlap on the straight line connecting them to the proposed station, since both the **IN** and **OUT** entries are positive in all cases except, of course, the entry reflecting the station being modified. Maps are provided for each entry where the straight line clearance was less than 20 km to certify the clearance extends to all azimuths. Visual inspection clearly shows there is no prohibited contour overlap; no FMOVE proofs are needed. The first two lines of the printout are applications for BPED-19931207MD, which are the applications that this amendment replaces. The next line of the printout is KZJC.CP, Ontario, a CP which has been requested to be surrendered by CSN International. The next line is KEFX which is shown to be clear of both incoming and outgoing overlap in the map.

Maps are sufficient to certify the clearance of all the other entries and where the lines are close all radials in the area of possible overlap are looked at.

#### **IF (53 or 54 channel spacing) relationships**

No relevant IF spaced stations were found in the study.

#### **TV channel 6**

Channel 6 protection for KIVI, Nampa is studied in Exhibit 18. This is the only TV channel 6 to be found within the 211 km radius for channel 206.

#### **Class Contour Distance**

The maximum proposed ERP is 8.75kW, the 8 radial HAAT is 667.5 meters and the class contour distance in kilometers is 68.78 km, which after rounding is 69 km. The 69 is greater than the maximum 52km for a Class C2 station but less than the 72km for a Class C1 station, therefore making this a Class C1 class filing according to §73.211(b)(1).

**This allocation study shows that no interference to existing or proposed FM stations will be produced by the proposed application. The Commission may properly grant a construction permit.**

## HOW TO READ THE FM COMPUTER PRINT-OUT

The computer print-out should be self-explanatory for the most part. The parameters of the station being checked, (reference station) are printed in the heading. The 60dBu protected contour is predicted from the Commission's F(50-50) table, while the 40, 54, 80 and 100 dBu contours are interference contours derived from the Commission's F(50-10) table. Contour distances are in kilometers and are predicted using spline interpolation from the data points identical to those published in Report No. RS 76-01 by Gary C. Kalagian. Critical contour distances are determined using the Commission's TVFMINT FORTRAN subroutine. When interference contour distances are less than 16 kilometers the F(50-50) tables are used. If signal contour distances are less than 1.6 km the free-space equation is used.

The column listed “\*IN\*” is the sum of the reference station’s 60 dBu protected contour and the data file station’s interference contour subtracted from the distance between the stations. (All distances are derived by the method detailed in Sec. 73.208 of the Rules and Regulations as amended in Docket 80-90). Therefore, the column is a measure of incoming interference. Negative distances in this column indicate the presence of interference. Listed antenna heights are the average heights of with standard radials as found in the Commission’s records unless otherwise noted, in which case the specific antenna heights along the azimuths between the reference station and the database station are used and visa versa. The column labeled “\*OUT\*” shows the distance of kilometers of overlap or clearance between the reference station’s interference contour and the database station’s protected contour. Negative distance figures in this column indicate outgoing interference.

For I.F., commercial, international and other spacing based relationships, the “IN” and “OUT” columns change their significance. The letter “R” stands for the minimum required distance in kilometers, while the letter “M” in the next column follows the available clear space separation in kilometers or “Margin”. Minimum commercial separation distances were taken from Sec 73.207 of the rules as amended. This procedure is also used for all Canadian and Mexican spacing. Canadian separation distances were derived from the “Canadian/American Working Agreement”.

Under the “BEARING” column, the first row of numbers indicated the bearings from true north of the data base stations in relationship with the reference station, while the numbers in the second row indicate the reverse bearings from the database station to the reference station.

The columns labeled “INT” and “PRO” hold the distance in kilometers of the appropriate interference contour and the protected contour of a data base station.

The first three letters of the “TYPE” column identify the current F.C.C. status of the stations. The fourth letter will be a “D” or “Z” (Sec. 73.215) if the facility is directional. The fifth letter will be an E, H or V depending on the type of antenna polarization. The sixth letter will be a ‘Y’ if the antenna uses beam tilt.
