

ENVIRONMENTAL STATEMENT
K268CV FORT COLLINS, COLORADO, CH. 215D
MOUNTAIN COMMUNITY TRANSLATORS, LLC
FCC FORM 349
APRIL 2016

The applicant proposes relocating its current antenna to an existing 24.4 meter un-registered tower. The proposed Center of Radiation will be 18 meters Above Ground Level. A horizontal and vertical polarization, Nicom model BKG-1, directional antenna is proposed. Calculations were made using FM Model for Windows, version 2.10. The proposed antenna Center of Radiation, above ground, was reduced by 2 meters to allow for the average height of a human on the ground. FM Model predicts a peak exposure of $1.57 \mu\text{w}/\text{cm}^2$ at a distance of 4 meters from the base of the tower. This represents 0.8 % of the allowable Maximum Permissible Exposure ("MPE") of $200 \mu\text{w}/\text{cm}^2$ for uncontrolled environments at any point on the ground. Since the Nicom antenna is not specifically listed in the FM Model program, the worse case "Type 1" antenna was used for the study.

The site is also utilized by KVMX(FM), Colorado, Facility ID 84102. From FCC records its worst case power density level at any point 2 meters above the ground is $4.338 \mu\text{w}/\text{cm}^2$. Even if both of these power density levels were directly added together, they would total $5.908 \mu\text{w}/\text{cm}^2$ at any point 2 meters above the ground at the site, or well below the $200 \mu\text{w}/\text{cm}^2$ power density limit for un-controlled areas.

The applicant will ensure that the public access to the tower is restricted by fencing, anti-climb devices or other appropriate measures. The site will be posted with RF warning signs. If climbing of the tower by authorized personnel becomes necessary,

transmitter power will be reduced to safe operating levels, or transmission even terminated, as necessary as not to exceed the RF exposure limits to tower workers. The licensee will cooperate with other users at the site with the scheduling of such tower or antenna maintenance.

No modification of the existing tower is proposed, other than the proposed side mounting of the antenna system and addition of a transmission line. The tower was constructed prior to March 16, 2001. The National Programmatic Agreement generally allows such a collocation without consultation or review under Section 106 and Subpart B of 36 CFR §800. The applicant believes that it is in full compliance with the Agreement, and that no further study is required.
