

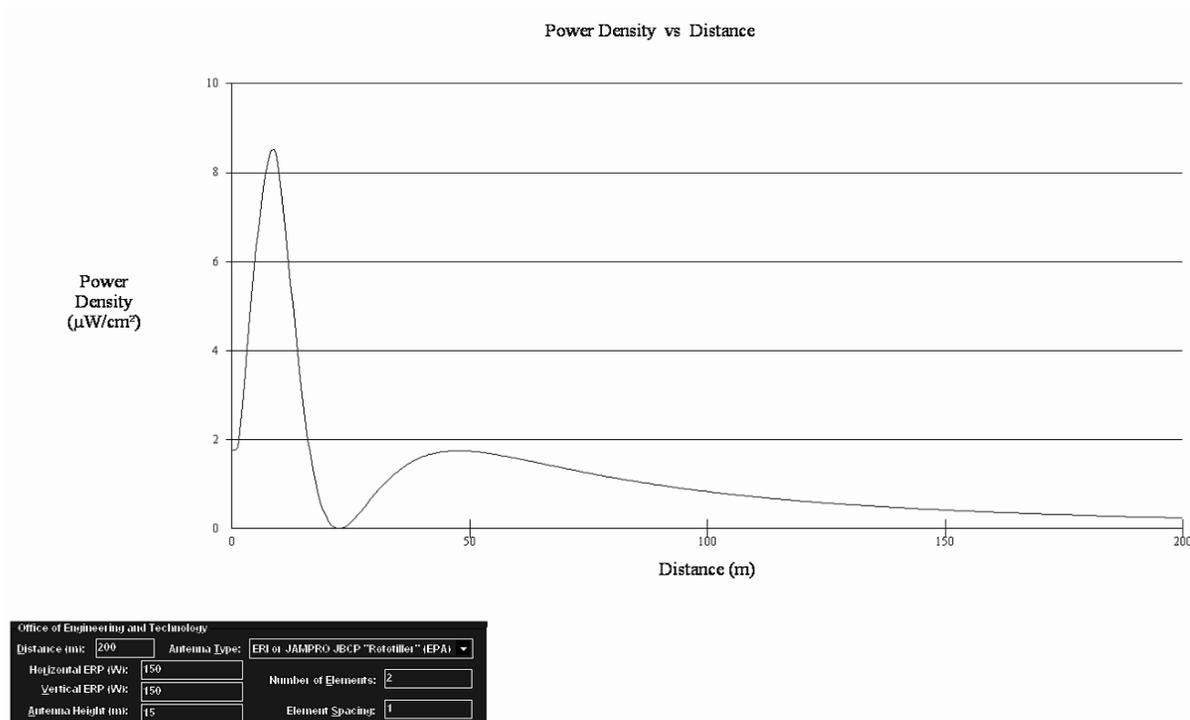

Exhibit 4

The above graph is for the proposed Goldfield application. The study is from the FCC FM-Model program to demonstrate compliance with ANSI and show that there will be no human radiation exposure with the proposed facility.

As can be seen by the graph, the exposure level is considerably below the level that has been deemed acceptable for public access beneath the tower. The tower itself will be inaccessible to the general public.

The applicant specifies that should workman be within an area of the apperture of the antenna which would cause exposure levels to exceed those considered safe, that the applicant will reduce or turn off the transmitter for the period of time that there are workman on the tower.

Therefore this application meets the requirements for environmental safety.
