Facilities Proposed

The proposed operation will be on Channel 286C2 (105.1 MHz) with an effective radiated power of 2.6 kilowatts. Operation is proposed with a 3-element circularly-polarized omni-directional antenna which will be installed on an existing guyed tower located atop Snow King Mountain. Diplexed operation is proposed with KXJN 249A Moose Wilson Road.

The proposed antenna support structure will not exceed 60.96 meters (200 feet) above ground and does not require notification to the Federal Aviation Administration. Therefore, this structure does not require an Antenna Structure Registration Number.

RF Exposure Calculations

The power density calculations shown below were made using the techniques outlined in OET Bulletin No. 65. "Ground level" calculations in this report have been made at a reference height of 2 meters above ground to provide a worst-case estimate of exposure for persons standing on the ground in the vicinity of the tower. The equation shown below was used to calculate the ground level power density figures from each antenna.

$$S(\mu W/cm^2) = \frac{33.40981 \times AdjERP(Watts)}{D^2}$$

Where: *AdjERP(Watts)* is the maximum lobe effective radiated power times the element pattern factor times the array pattern factor.

*D* is the distance in meters from the center of radiation to the calculation point.

Ground level power densities have been calculated for locations extending from the base of the tower to a distance of 1000 meters. Values past this point are increasingly negligible.

Calculations of the power density produced by the proposed antenna system assume a Type 1 element pattern, which is the "worst case" element pattern. The highest calculated ground level

Hatfield & Dawson Consulting Engineers

power density occurs at a distance of 2 meters from the base of the antenna support structure. At this point the power density is calculated to be 4.6 μW/cm², which is 4.9% of 200 μW/cm^2 (the FCC standard for uncontrolled environments).

These calculations show that the maximum calculated power density produced at two meters above ground level by the proposed operation of KJXN alone is less than 5% of the applicable FCC exposure limit at all locations between 1 and 1000 meters from the base of the antenna support structure. Section 1.1307(b)(3) of the Commission's Rules excludes applications for new facilities or modifications to existing facilities from the requirement of preparing an environmental assessment when the calculated emissions from the applicant's proposed facility are predicted to be less than 5% of the applicable FCC exposure limit. Therefore, the proposed facility is in compliance with Section 1.1301 *et seq* and no further analysis of RF exposure at this site is required in this application.

The permittee/licensee in coordination with other users of the site must reduce power or cease operation as necessary to protect persons having access to the site, tower or antenna from radiofrequency exposure in excess of FCC guidelines.

Power Density vs Distance
Ground-Level RF Exposure   **OET FMModel**

KJXN 286C2 South Park

Antenna Type: Shively 6832-3 (ring stub element model assumed)
No. of Elements: 3
Element Spacing: 0.78 wavelength

Distance: 1000 meters
Horizontal ERP: 2.6 kW
Vertical ERP: 2.6 kW

Antenna Height: 47 meters AGL

Maximum Calculated Power Density is 9.1 µW/cm^2 at 2 meters from the antenna structure.
