

Radio Station KDIA • 1640 kHz, Class B • Vallejo, California

Interference Protection FCC Form 301 §III-A, Question 10.b.

The proposed facility meets all FCC Standard Band Rules pertaining to skywave protection of all existing stations, permits, and applications, as summarized below.

RSS Calculations

The proposed facility enters into the 50% RSS of two other stations (KDZR and KBJA), but its contributions do not increase over those now authorized, as shown in the following Exhibit 16B. Radio Station XEUT-AM, 1630 kHz, has been allotted to Tijuana, Mexico, and an application has been filed for that station. Prior approval was given by FCC staff to include XEUT-AM in all nighttime RSS studies.

As shown in the table below, two stations make up the 50% RSS of the proposed facility, giving an interference-free contour level of 5.46 mV/m:

To KDIA 1640 kHz proposed

From	Freq	Dist	Bear	GM	Tmin	Tmax	Skywv	Thet	Rmax	Limit	RSS

“Clipping” Study

The proposed facility provides the required nighttime protections along the nighttime interference-free contours of all stations entitled to protection.

Preclusion Study

The directional pattern, Exhibit 11E, indicates that the proposed nighttime radiation in the main beam of the KDIA pattern would exceed the licensed non-directional radiation value of 333.0 mV/m @ 1 km through an arc beginning at 146°T through 326°T. Exhibits 16C and 16D show the area of potential increased interference from KDIA. However, based upon FCC expanded band rules, no new stations on the co-channel or a first-, second-, or third-adjacent channel can be allocated within this area.

The FCC expanded band rules require co-channel separation of 800 kilometers and first-adjacent channel separation of 200 kilometers. As shown in the attached Exhibit 16C, the 800-kilometer arc from Radio Station KDIA, 1640 kHz, precludes the allocation of 1640 kHz throughout the area subject to increased interference. Similarly, Radio Stations XEUT_AM, 1630 kHz, and KFOX, 1650 kHz, preclude the allocation of 1630 kHz and 1650 kHz throughout this area.

Radio Station KDIA • 1640 kHz, Class B • Vallejo, California

**Interference Protection
FCC Form 301 §III-A, Question 10.b.**

As shown in Exhibit 16D, new facilities on 1610 kHz, 1620 kHz, 1660 kHz, and 1670 kHz are also precluded throughout the area subject to increased interference. The combined 200-kilometer protection spacings of Radio Stations KUBA, KMNY, KGST, and KTAP, all 1600 kHz, and KSMH, 1620 kHz, preclude the allocation of 1610 kHz throughout this area, with KSMH also precluding the allocation of 1620 kHz. Radio Stations KTIQ, 1660 kHz, and KHPY, 1670 kHz, preclude the allocation of 1660 kHz and 1670 kHz, respectively, throughout the subject area.

Summary

The 10 kW directional operation proposed by Radio Station KDIA meets all allocations rules with regard to existing stations in the expanded band. In addition, the proposal meets allocation rules to all potential new allotments in the band allowed by expanded band rules and will not cause increased interference over the current licensed operation to any such allocation.

Radio Station KDIA • 1640 kHz, Class B • Vallejo, California

Skywave Interference Protection

Following are definitions for column heading abbreviations used in the tables:

Freq	is frequency in kilohertz.
Dist	is distance, in kilometers.
Bear	is azimuth, in degrees east from true north.
GM	is geomagnetic latitude of path midpoint, in degrees.
Tmin	is lower pertinent departure angle, in degrees.
Tmax	is higher pertinent departure angle, in degrees.
Skywv	is the 10% skywave signal for 100 mV/m radiated at 1 km, in mV/m.
Thet	is the departure angle between Tmin and Tmax where the radiation is greatest, in degrees. Note: for interference to Canada and Mexico, Thet = Tmin = Tmax departure angle (1) of Section 73.190, Figure 6a.
Rmax	is the radiation at departure angle Thet, in mV/m at 1 km.
Limit	is 20 times the skywave field at the receive point for co-channel stations and 2 times the skywave field for first adjacent stations, in mV/m.
RSS	is the square root of the sum of the squares of the limits, using the 50% and 25% exclusion rules, in mV/m.
