COMPREHENSIVE TECHNICAL EXHIBIT

Application for Flashcut Construction Permit
K48EG, FCC ID 58661
FCC File Number BLTT-19991004IF
SALISH KOOTENAI COLLEGE

Application for Flashcut, Minor Change. The within filing seeks a change of operating mode from NTSC to digital via the flashcut mechanism. Further, a small move to an improved tower site is included in the application. The service contour from the proposed site encloses most of that from the presently licensed site. The same community is served.

Use of unregistered tower. The tower specified in the within application is an unregistered 20 meter tall tower near the location of ASR #1003775. The tower planned for this application has been subjected to TOWAIR and that study reveals that registration is not required as the analysis shows that the slope to St. Ignatius airport is passed with ample clearance.

Interference Analysis. Following an OET 69 Longley-Rice study exhibit for the above-captioned application on channel 46 as performed by the Techware, Inc. FCC interference analysis program *tv_process_lp_dtv_d04_12* using a Sun Blade computer, the within application is found to fully comply with §74.793. Accordingly, the within application is grantable.
