Hello Cary,

While some work has been continuing on replacing broken and stolen copper to the ground system at WSRY, it has been discovered that there may also be an issue with the transmission line.

The work that has been performed in the summer now allows the Gates One transmitter to stay on at 325 watts during the daytime. This is a slight improvement over 6 months ago when the transmitter would have difficulty staying on at 310 watts at times.

Additional work will be need to be performed on the transmission line or have it replaced and on replacing copper strap and radials.
