To whom it may concern;

I have reviewed our file on the directional antenna for WFAZ, our shop order number 29373 and see that the direction antenna for WFAZ is mounted perpendicular to the Northwest face of the tower at 91 meter AGL.

The WJHO antenna is mounted on the Northeast leg of the tower at 104 meters AGL, so as long as the transmission feeding the WJHO antenna is attached to East side of the Northeast leg or attached to the Southeast leg there will be no measurable effect on the directional pattern for WFAZ.

If you have any questions or need more information, please do not hesitate to contact me.

Robert A. Surette
