ENGINEERING STATEMENT
APPLICATION FOR DAYTIME AND NIGHTTIME POWER INCREASE
RADIO STATION WVBE
1360 KHZ, 0.32 KW, 5.0 KW-LS, DA-2
ROANOKE, VIRGINIA
FACILITY NUMBER 41111
MINOR CHANGE

This Engineering Statement has been prepared on behalf of Mel Wheeler, Inc. ("Wheeler"), licensee of Radio Station WVBE, Roanoke, Virginia. Station WVBE is a licensed Class B station presently operating with 5000 watts during daytime hours and 1000 watts during nighttime hours on 610 kilohertz using different directional antenna systems.

The licensee presently holds Construction Permit File Number BP-20040112ABF authorizing construction of a four element directive array at the present transmitter site. It is respectfully requested that this permit be cancelled upon acceptance of the instant application.

By means of this application the licensee proposes to increase daytime power to 7.0 kilowatts, and change the nighttime power to 2.5 kilowatts using different directional antenna systems located on the existing transmitter site in Salem, Virginia.

This proposal is classified as a minor change under Section 73.3571(a)(2) of the Rules. The proposal is acceptable for filing under Section 73.37 of the Rules.

The proposed facility will not have a significant environmental impact under Section 1.1307 of the Rules.

A review of the existing construction permit for WVBE and the construction permit for co-owned WVBE revealed certain features of the plant design which prevent construction in compliance with the terms of the two permits. Tower-5 of the WVBE daytime array and tower-2 of the WFIR array are physically located too close together to permit proper detuning of either tower, making it unlikely that proper adjustment of any of the three directional patterns can be achieved. Further, the high circulating currents

unreasonable stresses on the filtering components required to properly decouple the two stations.

The daytime array of WVBE has been redesigned to permit operation at 7.0 kilowatts with very low circulating currents. The existing north tower (Twr-5) of the daytime array will be replaced with a tower equal in height to all others and a new tower (Twr-6) will be constructed west of the southeast tower of the existing array. These towers will be used in the WVBE daytime array and will permit construction of the WFIR array using the existing tower-4 and the new tower-6.

Proposed Transmitter Location

The location of the transmitter site is that of the presently licensed facility. This proposal requires dismantling on the north tower (Twr-5) of the present daytime directive array and replacement with a taller tower. One new tower (Twr-6 S-W) will be constructed at the location noted on the plat showing the towers and ground system. The coordinates of the center of the array and ground level elevations of the five towers were determined from the Salem, Virginia USGS 7.5 minute topographic map and by reference to satellite imagery.

The application also corrects the coordinates of the daytime and nighttime arrays as determined from satellite photographs of the present site. The registered tower coordinates appear to be correct for the five original towers. The coordinates for the two new towers were determined from the plotted tower locations on the Salem topographical map. The elevations for the two new towers were determined from the topographical map elevations.

The corrected NAD-27 coordinates for the center of the proposed daytime array are:

N.L.: $37^{\circ} 18' 11''$

W.L.: $80^{\circ} 02' 29''$

The corrected NAD-27 coordinates for the center of the proposed nighttime array are:

N.L.: $37^{\circ} 18' 12''$

W.L.: $80^{\circ} 02' 31''$

The site map appears herein as Exhibit E1-1D. Photographs of the site have been omitted since the site is the existing transmitter site for Station WVBE.

DAYTIME SECTION

Daytime Directional Antenna System

A five element array is proposed for the daytime operation. As indicated on Exhibit E1-1B, all radiating elements are of identical height. Each element has an electrical height of 85.0 degrees, a physical height of 116.1 meters (381 feet) and overall heights of 117.6 meters (386 feet) to 118.3 meters (388 feet) above ground level depending on the location on the property.

The vertical sketch of the proposed array appears herein as Exhibit E1-1B. The plat and horizontal plan sketch appear herein as Exhibit E1-1C.

The tower heights of the new towers 5 and 6 require FAA study and registration. The FAA has been notified of the proposals. The tower-5 registration will be modified and tower-6 will be registered on receipt of FAA approval.

The directional antenna system was designed in accordance with the criteria of Section 73.150 assuming a one ohm lumped resistance at the current loop of each tower of the array. The one ohm loss RMS was checked by RADIAT and found to agree with the design program calculations.

A summary of the specifications for the directional array appears herein as Exhibit E1-1A.

Compliance with Section 73.24(g)

The population within the proposed 1000 mV/m daytime contour was determined to be 1,044 persons. The population within the 25 mV/m contour was determined to be 186,880 persons, resulting in a 1,000 mV/m population percentage of 0.6 percent of the population within the 25 mV/m contour. This is less than the one percent specified in Section 72.24(g).

The population within the proposed 1000 mV/m nighttime contour was determined to be 385 persons; the population within the 25 mV/m contour was determined to be 147,436 persons resulting in a 1000mV/m population percentage of 0.3 percent of the population within the 25 mV/m contour. This is less than the one percent specified in Section 72.24(g). Thus the instant proposals comply with the Rule.

The station has operated for more than 60 years from this site with no known blanketing problems. Should any overload or blanketing problems be caused by the proposed construction, the licensee will undertake correction as required by the applicable Rules.

Daytime Allocation Study

The list of stations considered appears herein as Exhibit E1-2G.

The daytime allocation study is broken into four separate maps for clarity. All stations, authorized or proposed as noted in CDBS on July 31, 2009 were studied.

Exhibit E1-2A shows the relevant stations on the co-channel allocation. Exhibit E1-2B shows all stations relevant to the two first adjacent alloocation. Exhibit E1-2C shows all stations relevant to the second adjacent allocation. Exhibit E1-2D shows all stations relevant to the third adjacent channel allocation.

All contours were calculated from data in the Commission's CDBS files using the database current as of July 31, 2009. Field measurement data was used for conductivities for stations sufficiently close to the WVE transmitter site to require detailed study. The stations for which measured data was used include:

CO CHANNEL STATIONS:

WVBE, 610 kHz, Roanoke, VA (Subject)

WFNZ, 610 kHz, Charlotte, NC

WLVE, 610 kHz, Winchester, VA (Currently Silent)

FIRST ADJACENT CHANNEL STATIONS:

WWNR, 620 kHz, Beckley, WV

WVAR, 620 kHz, Richwood, WV

WSJS, Winston Salem, NC

WDNC, 620 kHz, Durham, NC

SECOND ADJACENT CHANNEL STATIONS:

WLVA, 590 kHz, Lynchburg, VA (CP and STA to operate on 580 kHz)

THIRD ADJACENT CHANNEL STATIONS:

WLVA, 580 kHz, Lynchburg, VA, (CP and STA to operate on 580 kHz)

Note: The terms of the STA top operate on 580 kHz involve an Interference Reduction Agreement ("IRA") with co-owned station WLES, Bel Air, VA now operating under STA

on 590 kHz. The IRA contains a commitment for WLVA to abandon operation on 590 kHz.

For other stations considered, the Commission's map M-3 was used as the source of conductivity data. No contours are sufficiently close to require use of measured data. The M-3 data files for those stations have been omitted in the interest of minimizing files size. The data files will be supplied should the Staff so request. All contours were calculated in accordance with Section 73.183 of the Rules.

The Daytime Standard Pattern tabulation appears herein as Exhibit E1-2E. The graphical plot appears here as Exhibit E1-2F.

The tabulation of daytime margins and radiation limits appears herein as Exhibit E1-2H. Where clearance margins exceed reasonable levels, the file was truncated to eliminate meaningless data. All relevant stations in Region 2 were considered in the initial study.

NOTE REGARDING MEASURED CONDUCTIVITY FILES

All measured conductivity data was previously accepted in BP-20040112ABF and has been consolidated in the following exhibits:

WVBE: Exhibit E1-2L-1. All others appear in Exhibits E1-2L-2 and E1-2L-3.

DAYTIME COVERAGE

Exhibit E1-2I contains a table of distances to contours used to generate the allocation and coverage maps for daytime service

Exhibit E1-2J shows the existing and proposed 0.5, 2.0 and 5.0 mV/m service contours. The 5.0 mV/m contour covers all of the city limits of Roanoke, Virginia as shown on Exhibit E1-2K

NIGHTTIME SECTION

Nighttime Directional Antenna System

The nighttime array was designed to protect all known existing and proposed stations in Region II. A nighttime study was first completed using all Region II stations. The files were then culled to remove all stations which exhibited a clearance margin greater than the value of the major lobe of the night pattern. These facilities are shown in Exhibit E1-3A, the nighttime permissible radiation study which also contains the 25 and 50 percent exclusion RSS interference studies for each station. The proposed

facility does not enter the 50% exclusion RSS calculation of any known existing or proposed domestic station nor does it cause interference to any Region II class A facility. The station enters the 25% exclusion calculation for Station WFNZ. This limit has not been increased. No other stations are affected by WVBE

The nighttime standard pattern was calculated in accordance with current Rules of the Commission. The nighttime directive array will utilize towers 1, 2, 3 and 4 of the daytime array with towers 5 and 6 detuned during nighttime hours. The plotted pattern appears herein as Exhibit E1-3B. The tabulation at vertical angles from the horizontal through 60 degrees elevation appears as Exhibit E1-3C.

The proposed WVBE nighttime interference free limit was determined to be 10.85 mV/m as shown in Exhibit E1-3D.

The distances to the nighttime interference free contour are tabulated in Exhibit E1-3E and plotted on the map of Exhibit E1-3F. The facility covers in excess of ninety percent of the land area within the city limits of Roanoke, Virginia. The facility will serve ninety percent of the population with an interference free signal.

Main Studio Location

The main studio will remain at its present location within the 5.0 mV/m daytime and 10.85 mV/m nighttime contours.

Environmental Considerations

The proposed site is a relatively flat area located within the Salem, Virginia city limits where the station has been located for more than 60 years. No significant disturbance of the property will be required to construct the proposed facilities. Some excavation will be required for construction of the ground system. No other significant ground work will be required.

The proposed operation is categorically excluded from further environmental processing. The site meets the criteria established in Section 1.1306 of the Rules.

The applicant is working to comply with the terms of the recently enacted Tribal Notification and site investigation requirements and will amend the instant application as soon as the investigation is completed. The land is located near an industrial park and an older housing area. There is no reason to believe, at this time, that the site contains

any artifacts of interest to any Indian Tribes. Upon completion of the process the Commission will be notified of the results.

RADIOFREQUENCY FIELDS

Due to imminent diplexing of Station WFIR on two of the towers of the site, a maximum power of 15 kilowatts in any one tower was assumed. The maximum operating power of WVBE is 7.0 kilowatts and maximum operating power of WFIR is 10 kilowatts. For an antenna with 10 kilowatts into a tower between 85 and 134 electrical degrees , OET Bulletin 65, Edition 97-01, August, 1997, suggests a fence having a minimum distance of from a tower or radio frequency feeder of 2 meters. For a tower with an operating power of 50 kilowatts, the minimum distance is 4 meters. For protection of the ground system and the coupling and filtering apparatus in the immediate vicinity of the tower bases, the applicant will construct a fence no closer than four meters from each tower. This will comply with the requirements of OET Bulletin 65.

It is evident that the proposed facility will be in full compliance with the guidelines of OET Bulletin 65.

The site will operate on a full time basis. Most, if not all, maintenance on the towers will be done during daytime hours. Suitable non-directional networks will be constructed at two towers to facilitate low power non-directional operation during such maintenance. Should work be required during operation, the power will be reduced to a safe level in the appropriate non-directional mode or operations will be suspended for the duration of the required work.

CERTIFICATION OF ENGINEER

I hereby state that:

I am President of Sellmeyer Engineering

The Firm of Sellmeyer Engineering has been retained by Mel Wheeler, Inc. to prepare this Engineering Exhibit

I am a graduate of Arizona State University with the degree of Bachelor of Science in Engineering

I am a Registered Professional Engineer in the States of Ohio and Texas

My qualifications as an Engineer are a matter of record with the Federal Communications Commission

This Engineering Exhibit was prepared by me personally or under my direct supervision, and

All facts stated herein are true and correct to the best of my knowledge and belief.

EXHIBIT E1-1A
DESCRIPTION OF PROPOSED ANTENNA SYSTEM
RADIO STATION WVBE
610 KHZ, 2.5 KW, 7.0 KW-LS, DA-2
ROANOKE, VIRGINIA

TOWER DETAILS

The proposed directional antenna system consists of four vertical steel radiators arranged in an in-line configuration with a fifth radiator located east of the northwest tower and a sixth radiator located west of the southeast element of the in-line elements. All towers are 381 feet (116.1 meters) in height (85.0°) at the operating frequency of 610 kilohertz. Each of the elements is series fed.

GROUND SYSTEM

The ground system consists of 120 number 10 AWG copper wire radials, uniformly spaced about the base of each tower, 405 feet (123 meters) in length, except where they intersect with those of another tower where they are bonded to a transverse copper strap. An additional 120 number 10 AWG copper wire radials, 50 feet (15.2 meters) in length, will be interspersed with the longer radials. All radials will be buried at a depth of six to ten inches below grade level. All radials will be silver soldered to the ground ring around the tower base, antenna coupler pad, transverse strap or transmitter building pad as applicable.
