ENGINEERING STATEMENT

Concerning an amendment to a minor change application for new station at Fitzwilliam Depot, NH.

The FCC staff found in their studies that the proposed night power would contribute to the 50%RSS of accepted Canadian proposal at Pembroke, ON. This amendment changes the night pattern parameters and power to insure that the treaty obligations towards Pembroke are adequately met. Other exhibits requested are also supplied in this amendment.

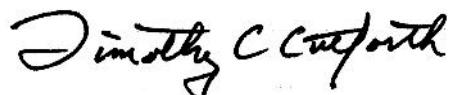

The proposed night coverage encompasses 80% of the area of Fitzwillian Depot as shown on the night coverage map exhibit. In the event that the FCC staff should find that a waiver of FCC rules is necessary for the proposed night operation such a waiver is hereby requested. The proposed 29.3 mV/m night limit is not the actual night limit existing. The largest contributor to the night limit is Pembroke, ON and Because the Canadian allocation is only a proposal and no application to use that allocation has been filed in Canada for over 20years it is unlikely that the Pembroke, ON 880kHz allocation will ever come on the air. Broadcasters in Canada have embraced the Eureka digital broadcasting system and have begun turning in AM broadcast licenses as part of that transition although international treaty obligations require applicants to protect that notification. Without an operating facility at Pembroke, ON the actual night limit is 16.5 mv/m and is also shown on the coverage map. The 16.5 mV/m contour completely encompasses the community of Fitzwilliam Depot. In addition, whereas much of New Hampshire is rocky, the proposed facility is located adjacent to a stream in lowlands and conductivity measurements would certainly show greater than M3 conductivities in the direction of Fitzwillian Depot.

The array coordinates were changed slightly to exactly match the registered coordinates of the center tower to the tenth of a second. The prior coordinates were different only in that they are the result of rounding off to the nearest second. All exhibits except for the form 301 and the aerial photograph use the previous coordinates rounded to the nearest second. The change from rounding to the tenth of a second from rounding to

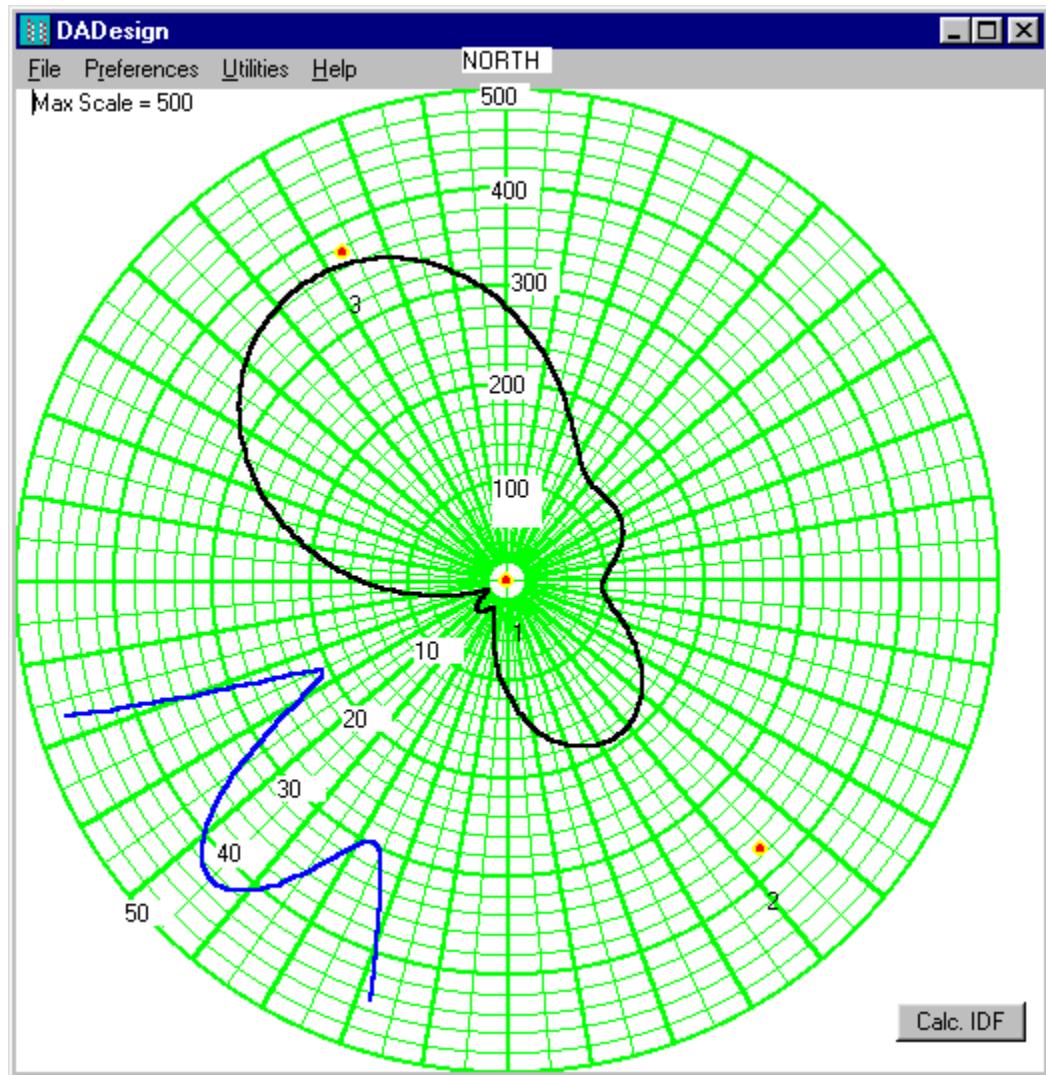

the even second has no effect on any allocations or coverage showing. The three tower registrations noted in the letter are necessary because the proposed Fitzwilliam Depot facility is proposed to share the site with WXNH and will share the southwest tower of the WXNH directional array.

Also included in this filing are the aerial photograph of the site with the 1V/m day and night contour superimposed on it, a ground system plat a vertical tower sketch, and a city grade coverage map showing both daytime and nighttime contours. The ground system will consist of 120 radials around each tower with 138 m long radials around the center tower and 84 m long radials around the two end towers except where shortened at a common strap where the radials would overlap.

Respectfully,

Timothy C. Cutforth
30 June 2006
