

Exhibit EE-1: Engineering Statement in support of
FCC FORM 349

APPLICATION FOR AUTHORITY TO CONSTRUCT OR MAKE CHANGES IN AN FM TRANSLATOR OR FM BOOSTER STATION
(For a New Auction 100 FM Translator [long form])

This engineering exhibit supports a long form application for an FM translator (Facility ID 202456), Tampa, FL. File number BNPFT-20180125ACR. Channel 271 is requested with an ERP of 95W.

This FM translator is a fill-in facility for Class B AM station, WTMP (Fac. ID # 74108), a class B AM radio station licensed to Egypt Lake, FL.

The proposed facility's 102.5dB μ contour is within the protected contour of 2nd adjacent station WHPT, Sarasota, FL. It is also within the 76dB μ protected contour of 3rd adjacent station WPOI. Since WHPT is the weaker adjacent signal, demonstrating no interference to WHPT also demonstrates no interference to WPOI. WHPT's 62.5dB μ contour completely encompasses the new facility's proposed 102.5dB μ interfering contour. A D/U analysis shows that no interference reaches or approaches the ground nor any occupied structure or elevated roadway. Therefore this proposal should be acceptable under 74.1204(d) and a "Living Way" waiver is hereby requested.

The proposed facility protects LPFM stations WPBW-LP, WSDX-LP, WPHX-LP, WWFH-LP, FM translator W270DH and FM translator application BNPFT-20180125ACR. WSDX, WPHX, BNPFT-20180131AIE and W270DH are 1st adjacencies, while WPBW, WWFH and are co-channel facilities. Limited power and a directional antenna are used to protect each of these facilities. Appendix C is the proposed directional antenna pattern. The maximum power is limited by interference to 95W (0.095kW). This channel is also limited at this location to a maximum of 99W (0.099kW) by I.F. station WCIE.

Genesis Communications of Tampa is also filing a long form application for BNPFT-20180131AIE in coordination with this application.

The proposed facility is in compliance with 47 C.F.R. Section 1.1306 with regards to radio-frequency electromagnetic exposure in that the contribution to the rf environment is less than 5% of the maximum public exposure.

This application was prepared using FCC 30-arc-second terrain data.

Attached as Figure 1 is a color coded map showing the protected contours of all relevant FM facilities and the associated interfering contours from the proposed facility.

Figure 2 shows the proposed 1mV service contour of this application compared with the 2mV service contour for WTMP.

Figure 3, Study 1 and Appendix A demonstrate that no harmful interference will occur to 2nd adjacent channel station WHPT. No interference is predicted to occur to stronger station WPOI.

The proposal is sufficiently distant from all facilities mentioned in 73.1030(a), (b) & (c) so that notification under 73.1030 is not required.

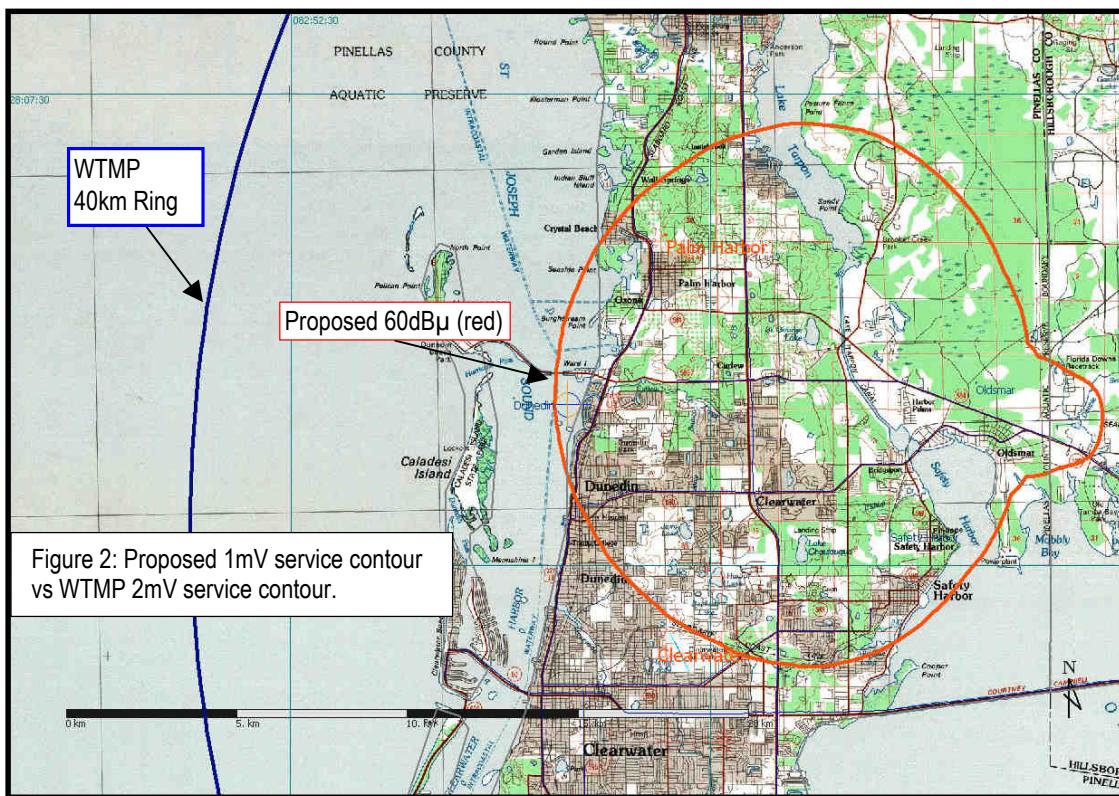

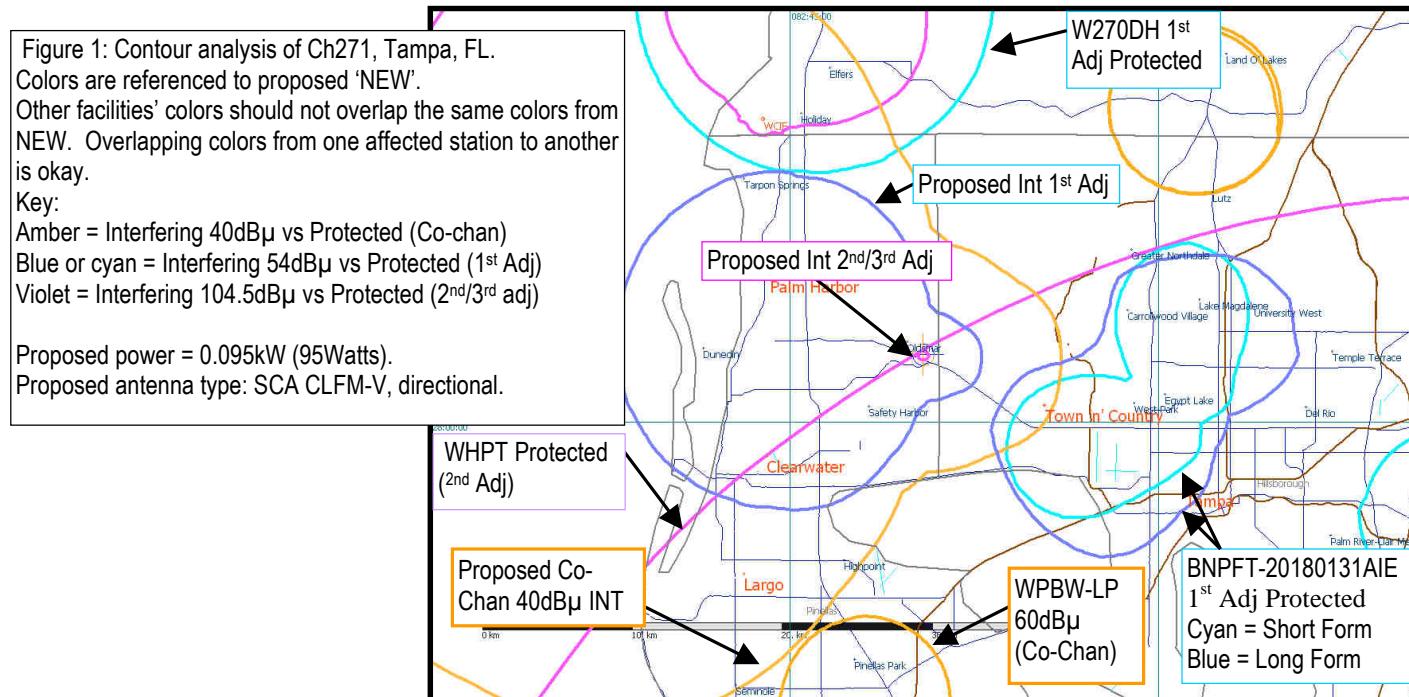

Respectfully submitted

Analysis:

The proposed facility is inside the Tampa, FL radio market. This application changes antenna orientation and power.

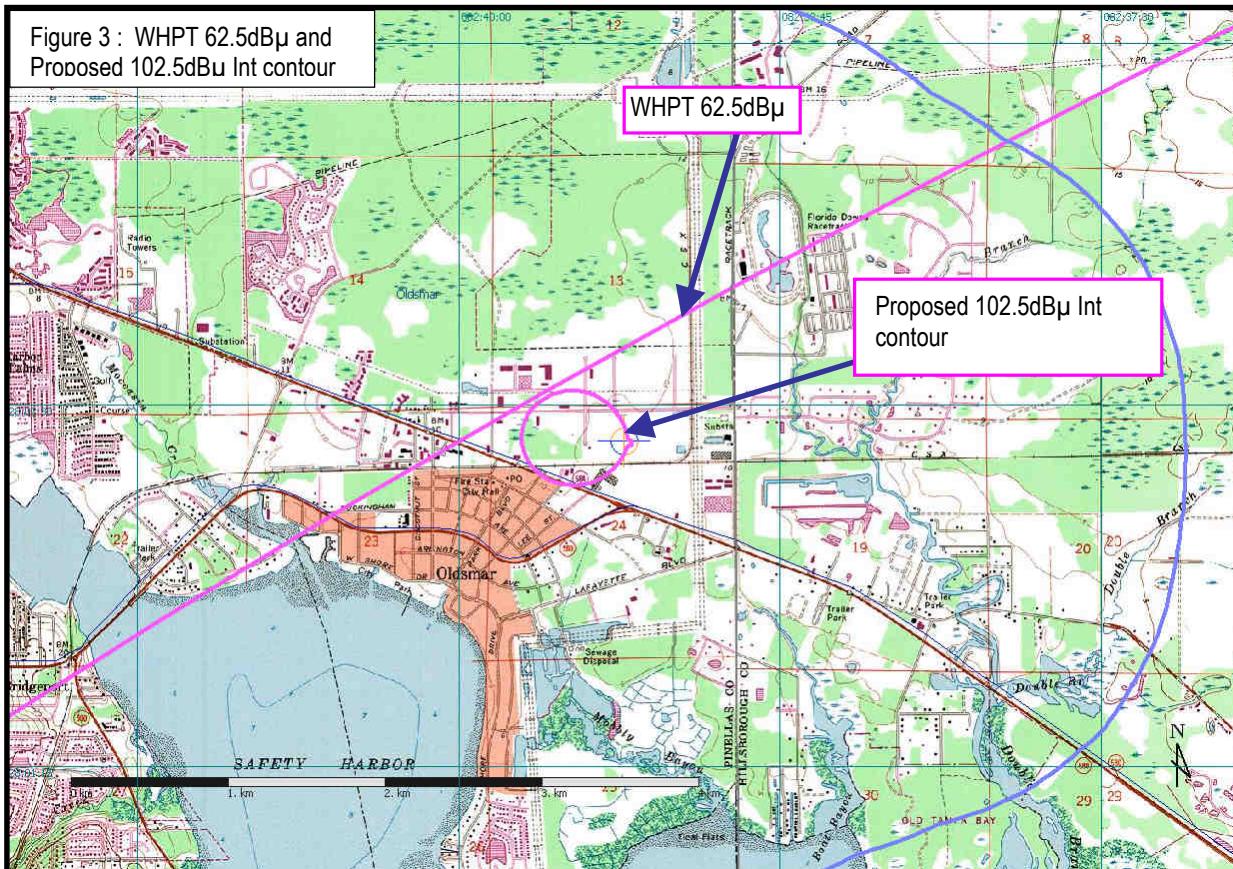

Desired to Undesired ratio (D/U) studies of facility vs WHPT Methodology:

The WHPT 62.5dB μ contour encompasses the proposed facility's 102.5dB μ contour.

The proposed facility is located adjacent to housing and roads, therefore it is necessary to prevent the interfering contour from reaching the ground.

All of the affected areas are completely contained within the WHPT 62.5dB μ contour. Therefore the worst case scenario for interference is $62.5\text{dB}\mu + 40\text{dB}\mu = 102.5\text{dB}\mu$.

Spreadsheets were used to calculate the distance to the interfering contours and show the margins of clearance (in dB) at a point two meters AGL. Where the interfering contour reaches near the ground, the table indicates how far from the tower the interference will reach. In the case of this facility, a one-bay directional antenna will be employed. The result is that the interfering contour does not reach the ground and does not reach any occupied structure or roadway. The spreadsheet output is attached as Appendix A.

Interference Study 1:

Terms and Methodology

Max ERP: The power specified in the application, expressed in kW.

Angle below the Horizon: The radiation angle below the antenna's horizontal plane.

Field at Angle: The field supplied by the antenna manufacturer for each Angle below the Horizon.

ERP at Angle: The ERP for an Angle given Max ERP & Field:

$$\text{ERP@Angle} = \text{Max ERP} * \text{Field}^{\text{Angle}}$$

Signal at Point: The predicted signal level assuming Free Space attenuation at a point:

$$\text{Signal} = 104.52 - (20 * \log(\text{Dist(km)})) + (10 * \log(\text{ERP@Angle}(kW)))$$

Distance to Point: The radiation path distance from the antenna to a point.

$$\text{DistToPoint} = \text{Antenna Rad Center in meters AGL}/(\cos(90^\circ - \text{Angle}))$$

Distance From Tower: The distance from the tower base to a point.

$$\text{DistToPoint} * \sin(90^\circ - \text{Angle})$$

Interference Threshold = Protected station's predicted contour value at a point +40dB μ

Over Threshold: The amount that the Proposal's signal exceeds the interference threshold.

$$\text{OverThresh} = \text{Signal} - \text{Interference Threshold}$$

A negative Over Threshold value indicates no interference.

Notes:

When finding a value for a point two meters above ground, then: DistToPoint = Antenna Rad Center in meters above the plane, not ground/(Cos(90° - Angle)). Subtracting 2 meters from the antenna RC produces the desired result.

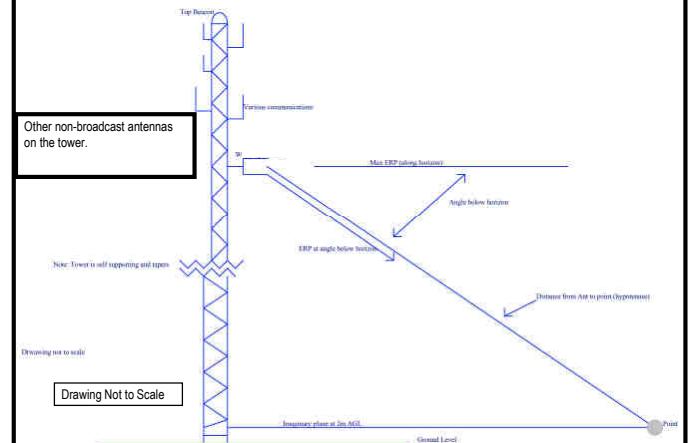

Results:

Appendix A (attached to this application) shows the angle and distance to a point 2meters AGL from the proposed antenna.

The Appendix A table also shows the distance to the interfering contour at 95W (.095kW).

The field strength is calculated at each end point and compared to the worst case protected contour of WHPT (62.5dB μ). Using the manufacturer's specified field elevation data, Appendix A shows that, at 2 meters above the ground, the interference threshold of 102.5dB μ does not reach the ground. There is one six-story building within the WHPT 62.75dB μ contour. Appendix B shows that the proposed 102.75dB μ contour does not reach the top floor of the building. The 102.5dB μ contour does not reach any occupied structure or roadway. Other than the one structure, no other elevated public roads or occupied multi-story buildings extend into the zone of interference on any radial. It can be concluded that no interference is predicted to occur to WHPT or the stronger WPOI as a result of this proposal.

Exhibit EE-1, Study 1, tower sketch

Section VII Engineering Data:

Tech Box Data:

1. Channel: **271**

Primary Station: **FID: 74108**

WTMP

Egypt Lake, FL

1150 kHz

Delivery Method: **Other**

Antenna Location Coordinates: (NAD27):

28° 02' 20.5" N

82° 39' 20.7" W

Antenna Structure Registration: **1027568**

Antenna Location Site Elevation Above Mean Sea Level: **3 meters**

Overall Tower Height Above Ground Level: **195 meters**

Height of Radiation Center Above Ground Level: **190 meters**

ERP:

0.095 kW (H)

0.095 kW (V)

Transmitting Antenna: **SCA CLFM-V (or equiv) Directional.**

Fill-in Translator: **Yes** (see EE-1, Figure 2)

Interference: **Yes**

Section 74.1204, **Checked**. See EE-1, Figure 1

Section 74.1205, **Not Checked**.

Unattended operation: **Yes**

Multiple Translators: **Yes**

NEPA: **Yes**. This proposal is excluded from environmental processing: The rf exposure was modeled using “FM Model” (from the FCC website) using a 1-element antenna at a height of 188m. The modeled maximum rf near the base of the tower is less than $1 \mu\text{W}/\text{cm}^2$ which is well below 5% of the uncontrolled public exposure limit, so no further processing is required. No changes to structure, lighting, land or water are proposed. Applicant will cease radiating if workers are near the antenna.
