

The transmit antennas for W283AQ, which consist of horizontally and vertically polarized Scala Model FM-HV, are mounted at the 63 – meter elevation on a uniform cross section, guyed Pi-Rod tower. This tower is mounted directly to a concrete foundation, therefore, no base insulator is required or present. This information is available at the shared WRVZ-FM transmitter site and is based on my personal observations of the installation.

As a certified Senior Broadcast Engineer affiliated with the Society of Broadcast Engineers, I attest on this date that the above information is true and accurate to the best of my knowledge.

A handwritten signature in cursive script, reading "Noel W. Richardson".
