

S.O. 22506
Report of Test 6810-2R-DA
for
Mountaintop Broadcasting
KLFC 88.1 MHz Branson, MO

OBJECTIVE:

The objective of this test was to demonstrate the directional characteristics of a 6810-2R-DA to meet the needs of KLFC and to comply with the requirements of the FCC construction permit, file number BPED-20000324ABH.

RESULTS:

The measured azimuth pattern for the 6810-2R-DA is shown in Figure 1. Figure 1A shows the Tabulation of the Horizontal Polarization. Figure 1B shows the Tabulation of the Vertical Polarization. The calculated elevation pattern of the antenna is shown in Figure 3. Construction permit file number BPED-20000324ABH indicates that the Horizontal radiation component shall not exceed 1.8 kW at any azimuth and is restricted to the following values at the azimuths specified:

0-50 Degrees T: 320 watts
330-360 Degrees T: 320 watts

From Figure 1, the maximum radiation of the Horizontal component occurs at 137 Degrees T to 150 Degrees T and at 195 Degrees T to 262 Degrees T. At the restricted azimuth of 0-50 Degrees T the Horizontal component is 7.959 dB down from the maximum of 1.8 kW, or 288 W. At the restricted azimuth of 330-360 Degrees T, the Horizontal component is 7.744 dB down from the maximum of 1.8 kW, or 303 W.

The R.M.S. of the Horizontal component is 0.795. The total Horizontal power gain is 1.628. The R.M.S. of the Vertical component is 0.765. The total Vertical power gain is 1.596. See Figure Four for calculations. The R.M.S. of the FCC composite pattern is 0.840. Therefore this Pattern complies with the FCC requirement of 73.316(c)(2)(ix)(A).

METHOD OF DIRECTIONALIZATION:

One bay of the 6810-2R-DA was mounted on a tower of exact scale to a Rohn 24" tower. The spacing of the antenna to the tower was varied and vertical parasitic elements were attached to the interbay feedline to achieve the vertical pattern shown in Figure 1. A horizontal parasitic element was placed directly under the bay. The position of this horizontal parasitic element was changed until the horizontal pattern shown in Figure 1 was achieved. See Figure 2 for mechanical details.

METHOD OF MEASUREMENT:

As allowed by the construction permit, file number BPED-20000324ABH, a single level of the 6810-2R-DA was set up on the Howell Laboratories scale model antenna pattern measuring range. A scale of 4.5:1 was used.

SUPERVISION:

Mr. Surette was graduated from Lowell Technological Institute, Lowell, Massachusetts in 1973 with the degree of Bachelor of Science in Electrical Engineering. He has been directly involved with design and development of broadcast antennas, filter systems and RF transmission components since 1974, as an RF Engineer for six years with the original Shively Labs in Raymond, ME and for a short period of time with Dielectric Communications. He is currently an Associate Member of the AFCCE and a Senior Member of IEEE. He has authored a chapter on filters and combining systems for the latest edition of the CRC Electronics Handbook and for the 9th Edition of the NAB Handbook.

EQUIPMENT:

The scale model pattern range consists of a wooden rotating pedestal equipped with a position indicator. The scale model bay is placed on the top of this pedestal and is used in the transmission mode at approximately 20 feet above ground level. The receiving corner reflector is spaced 50 feet away from the rotating pedestal at the same level above ground as the transmitting model. The transmitting and receiving signals are carried to a control building by means of RG-9/U double shielded coax cable.

The control building is equipped with:

Hewlett Packard Model 8753 Network Analyzer

PC Based Controller

Hewlett Packard 7550A Graphics Plotter

The test equipment is calibrated to ANSI/NCSL Z540-1-1994.

TEST PROCEDURES:

The corner reflector is mounted so that the horizontal and vertical azimuth patterns are measured independently by rotating the corner reflector by 90 degrees. The network analyzer was set to 396.45 MHz. Calibrated pads are used to check the linearity of the measuring system. For example, 6 dB padding yields a scale reading of 50 from an unpadded reading of 100 in voltage. From the recorded patterns, the R.M.S. values are calculated and recorded as shown in Figure 1.

VALIDATION OF GAIN CALCULATION

KLFC BRANSON, MO

MODEL 6810-2R-DA

Elevation Gain of 6810-2R-DA equals 0.990

The RMS values are calculated utilizing the data of a planimeter.

Horizontal RMS divided by Vertical RMS equals
 $0.795 \div 0.765 = 1.0392$

Elevation Gain of Horizontal Component equals
 $0.990 \times 1.0392 = 1.029$

Elevation Gain of Vertical Component equals
 $0.990 \times 0.962 = 0.953$

Horizontal Azimuth Gain equals $1/(\text{RMS})^2$
 $1/(0.795)^2 = 1.582$

Vertical Azimuth Gain equals $1/(\text{RMS} + \text{Max Vert})^2$
 $1/(0.765 + 0.990)^2 = 1.675$

* Total Horizontal Gain is Elevation Gain times Azimuth Gain
 $1.029 \times 1.582 = 1.628$

* Total Vertical Gain is Elevation Gain times Azimuth Gain
 $0.953 \times 1.675 = 1.596$

ERP divided by Horizontal Gain equals Antenna Input Power
 $1.80 \text{ kW} \div 1.628 = 1.106 \text{ kW}$

Antenna Input Power times Vertical Gain equals Vertical ERP
 $1.106 \text{ kW} \times 1.596 = 1.765 \text{ kW}$

Maximum Value of the Vertical Component squared times the
Maximum ERP equals the Vertical ERP
 $(0.990)^2 \times 1.80 \text{ kW} = 1.764 \text{ kW}$

NOTE: Calculating the ERP of the Vertical Component by two methods validates the total antenna gain calculations

Attn: Mr. Herb Smith

Re: The orientation of the new antennas on the tower located on Gibson Road, Taney County, Missouri.

Dear Mr. Smith;

Rozell Survey Company was requested on two different occasions to locate the azimuth new antennas on the existing tower. The first location was attempted on July 23, 2002. This attempt was terminated when the equipment failed. The second location was completed on August 1, 2002. Based on the field location at this time the following affidavit is being prepared.

STATE OF MISSOURI)
COUNTY OF STONE)

I, Kenneth J. Buchanan, Missouri Professional Land Surveyor No. LS-2340, upon my oath declares the following:

1. I instructed one of my field crews to locate the position on the new antenna on the tower site on Gibson Road.
2. I, instructed the crew to locate a visible face on the antenna from two separate positions no closer than ten feet from each other, to determine the antenna azimuth.
3. The field crew observed the installation of the upper portion of the new antenna, and assisted the installers in determining the correct orientation of the upper portion of the antenna.
4. The two locations, determined the final placement of the antenna to be at a **Grid azimuth of 184°20'** and an **Astronomic azimuth of 183°53'**.
5. The lower portion of the new antenna was placed after the Rozell Survey field crew had left the site.

6. Based on visual conformation by Mr. Herb Smith and the Site foreman the two portions of the antenna are in line with one and another.

IN WITNESS HEREOF, I set my hand and seal this 5th day of August, 2002

Kenneth J. Buchanan
Kenneth J. Buchanan, LS 2340

SUBSCRIBED AND SWORN before me, a Notary Public, on this 5th day of August, 2002.

I was retained as technical consultant by KLFC radio for upgrades of the transmitter site near Branson, Mo. I have approximately 11 years of radio engineering experience and have certified installation of multiple directional FM stations during that time. I observed the installation of the directional antenna. To the best of my knowledge, the antenna and coax were installed per all manufacturer instructions and in the correct orientation.
