

EXHIBIT 14
(Page 1 of 39)

DAYTIME GROUNDWAVE INTERFERENCE STUDY
Cornerstone Church, Inc.
Rossford, OH

Nine stations enter into the daytime groundwave interference study:

WLGC	Greenup, KY	1520 kHz
WMLM	St. Louis, MI	1520 kHz
WWKB	Rochester, NY	1520 kHz
WQCT	Bryan, OH	1520 kHz
WINW	Canton, OH	1520 kHz
WJMP	Kent, OH	1520 kHz
WJKN	Jackson, MI	1510 kHz
WVAC	Norwalk, OH	1510 kHz
WLQV	Detroit, MI	1500 kHz

Tables 14.0 through 14.8 present the tabulations of the normally protected contours for each of these stations. Measured conductivity data, extracted from the FCC's files, was used in projecting the contours for these stations whenever such measured conductivity data was found to be available. Additional field strength measurements were also conducted on WJKN. Copies of the measured conductivity data for these stations are contained in Appendices A through G of this exhibit. The measured conductivity data for each station was supplemented with conductivity data extracted from FCC Figure M3 and the Canadian Conductivity Map in the areas where the measured values were not applicable. For stations where there was no measured conductivity data available, the normally protected contours were projected using theoretical conductivity data from FCC Figure M3 and the Canadian Conductivity Map. It should be noted that WLGC and WLQV each hold a construction permit to modify their daytime facilities. The WLGC construction permit reflects a correction to the geographic coordinates for the existing WLGC transmitter site. The WLQV construction permit reflects a modification to the station's licensed daytime facilities to reduce the electrical height of each of the

EXHIBIT 14
(Page 2 of 39)

nine towers used for the present daytime directional pattern with no changes to the other electrical parameters, physical geometry, or location of this antenna system. The WLQV construction permit also specifies corrected geographic coordinates for the center of this array. Since the daytime contours for the WLCG and WLQV construction permit facilities are essentially identical to the daytime contours for the licensed facilities for both of these stations, providing the required protection to the licensed facilities of these stations will also provide the required protection to the facilities authorized by each station's construction permit.

Table 14.9 lists the WDMN proposed daytime contours. Since the proposed WDMN transmitter site lies within two miles of the transmitter site of WJYM - Bowling Green, Ohio (730 kHz), FCC policy permits the use of conductivity data extracted from the WJYM 1961 full proof of performance (BL-8105) in the projection of the proposed WDMN daytime contours. It should be noted that additional field strength measurements were also conducted on WJYM. This additional measured conductivity data was also used in the projection of the proposed WDMN daytime contours. This measured conductivity data was supplemented with theoretical conductivity data extracted from FCC Figure M3 and the Canadian Conductivity Map. Copies of the measured conductivity data for WJYM are contained in Appendices H and I of this exhibit.

Figure 14.0 presents, on an M3 map base, the 25 mV/m, 5 mV/m, 0.5 mV/m, 0.25 mV/m, 0.025 mV/m, and 0.005 mV/m contours for the proposed WDMN daytime facilities in relation to the normally protected contours for each of the above stations. As

EXHIBIT 14
(Page 3 of 39)

can be seen from this figure, prohibited groundwave contour overlap will exist between the proposed WDMN daytime facilities and two of these stations:

WQCT	Bryan, OH	1520 kHz
WJMP	Kent, OH	1520 kHz

Since prohibited overlap presently exists between WDMN and both of these stations, detailed allocation studies were conducted to verify that the proposed facilities will reduce the areas of overlap with each of these stations. Table 14.10 tabulates the 0.5 mV/m and 0.025 mV/m contours for the presently licensed WDMN daytime facilities. These contours were projected using measured conductivity values extracted from the WDMN 1967 daytime full proof of performance (BL-11,577), supplemented with theoretical conductivity data extracted from FCC Figure M3 and the Canadian Conductivity Map. Copies of the measured conductivity data for the WDMN licensed daytime facilities is contained in Appendix J of this exhibit. Figure 14.1 presents a detailed allocation study showing the WDMN present and proposed 0.5 mV/m and 0.025 mV/m contours in relation to the respective contours of WQCT. As shown by this figure, the proposed WDMN daytime facilities will reduce the area of overlap that presently exists between its 0.025 mV/m contour and the 0.5 mV/m contour of WQCT from 187.1 square kilometers to 154.8 square kilometers. This figure also shows that the proposed WDMN daytime facilities will reduce the area of overlap that presently exists between its 0.5 mV/m contour and the 0.025 mV/m contour of WQCT from 4569.5 square kilometers to 4377.4 square kilometers. Thus, the proposed WDMN daytime facilities will provide the required protection to WQCT.

Figure 14.2 depicts the WDMN present and proposed 0.5 mV/m contours in relation to the 0.025 mV/m contour for WJMP. This figure shows that the proposed WDMN

EXHIBIT 14
(Page 4 of 39)

daytime facilities will reduce this area of overlap from 987.1 square kilometers to 25.8 square kilometers. Thus, the proposed WDMN facilities will provide the required protection to WJMP.

Finally, as shown in Figure 14.0, the proposed WDMN daytime facilities will provide the required groundwave protection to all other stations requiring consideration.
