EXHIBIT 16 - INTERFERENCE ANALYSIS

**APPLICATION FOR NEW NCE FM
210A - GALLUP, NM**

A computerized search of the F.C.C. CDBS was conducted to determine which, if any, existing stations or applications required a detailed interference analysis.

The following facilities were found to merit a detailed study:

CO-CHANNEL

KUNM	210C	Albuquerque, NM	Facility ID - 6083
------	------	-----------------	--------------------

1st ADJACENT CHANNEL

KTDB	209C3	Ramah, NM	Facility ID - 55010
------	-------	-----------	---------------------

For each facility the protected 60 dBu F(50,50) and pertinent interference F(50,10) contour was calculated and plotted. The protected 60 dBu and pertinent interference contours of the proposed operation were also calculated and plotted. All contours were calculated in one degree increments of azimuth.

As shown on the attached Figure 1, the proposed operation will not generate prohibited interference to, nor receive prohibited interference from any existing or proposed facility.

Figure 2 is an expanded view of the proposed area and demonstrates the lack of prohibited overlap to and from KUNM and KTDB.

The applicant believes the proposed facility is in full compliance with the applicable contour overlap provisions of 47 C.F.R. §73.509.
