WCMF-FM FCC 301 Application
Section III-B Environmental
Infinity Radio License Inc.
August 7, 2001

Infinity Radio License Inc. ("Infinity"), the licensee of WCMF-FM, Rochester, New York, proposes to install an auxiliary antenna, at a multi-user transmitter site located at geographic coordinates 43° 10' 14" North Latitude, 77° 40' 24" West Longitude (NAD27), using an ERI model SHPX- 2E antenna, 1 wavelength spacing. The proposed ERP is 15 kW H & V at a center of radiation 122 meters above ground level (AGL

An analysis has been made of the human exposure to RFR using the calculation methodology described in OET Bulletin 65, Edition 97-01, prepared by the FCC Office of Engineering and Technology. This analysis was made using a series of reference points two meters above ground level in the area surrounding the base of the antenna supporting structure.

At the worst case location, 60 meters horizontal distance from the base of the tower, the calculated auxiliary antenna power density would be 8% of the FCC MPE limit for general population/uncontrolled exposure. At the conclusion of installation, Infinity Radio License Inc. will take appropriate measurements to assure compliance with applicable FCC MPE limits.

If work is done on the tower in an area where over exposure could occur, Infinity will take necessary action to prevent the overexposure of workers on the tower including reducing the WCMF-FM transmitting power or ceasing operation completely.

The instant proposal is categorically excluded from environmental processing since none of the conditions of Sections 1.1306(b)(1), (2), or (3) of the FCC Rules would be involved for the following reasons:

1. The WCMF-FM auxiliary antenna facility will utilize an existing supporting structure that is not in or near any location referenced in Section 1.1306(b)(1) of the FCC Rules as being of environmental interest.
2. The provision of Section 1.1306(b)(2) of the FCC Rules relating to the use of high-intensity strobe lighting does not apply since no change in the existing lighting is proposed.
3. Finally, with regard to RFR exposure concerns, compliance with applicable FCC MPE limits would be achieved.
