ENGINEERING STATEMENT
Of

Kevin Terry

In Support of an

Application for
FM Construction Permit

Facility Number 72769

Nephi, Utah

Channel 280C - 103.9 mHz
ERP: 1.0 kW (H&V)
HAAT: 301 Meters (H&V)

September 4, 2002

General

As Director of Engineering of Millcreek Broadcasting, LLC, licensee of KMDG FM Nephi, Utah, I have been authorized to conduct engineering studies and prepare and submit the engineering portion of an Application for Construction Permit for Auxiliary Facilities for KMDG FM. Utah is an extremely rugged state that endures extreme winter weather conditions. It is due to access concerns to the KMDG main transmitter site, that the licensee has chosen to apply for auxiliary facilities to be used in the event of a transmission failure at the main site.

The attached exhibits will show that when the KMDG AUX operates as an Auxiliary Facility with an ERP of 1.0 kW at its auxiliary site it will be in compliance with all of the Commission's Rules and Regulations.

The Proposed Technical Parameters are as follows:

ASRN:	1210829
COORDINATES:	N39-43-58, W111-56-34
ERP:	1.0 kW
COR AGL:	128 meters
COR AMSL:	2044 meters
HAAT:	301 meters

The Site, Surrounding Terrain, and Predicted Service Contours

A map showing the transmitter site location is provided in Exhibit E, Figure 2.

A computer study was conducted to determine the average terrain elevations for each of the 360 radials, beginning with true north, then at intervals of 1 degree, in accordance with the provisions of Section 73.313. The 8 cardinal radials were included in the generation of this terrain study. In accordance with current FCC practice, the distances to the contours were calculated without consideration given to terrain roughness correction factors. The average of each radial was taken from three to sixteen kilometers, at 0.1 kilometer intervals. The USGS 3-second terrain database was used to conduct the computer study. Exhibit E, Figure 3 is a copy of the terrain study and the contour study showing the distance to the service contours and the average elevations of each.

Exhibit E, Figure 4 is a map that shows the F(50,50) 60 dBu contours of the KMDG Main Facility and the proposed KMDG Auxiliary Facilities. As can be shown in Exhibit E, Figure 4, the entire 60 dBu contour of the proposed KMDG Auxiliary Facilities is fully encompassed by the F(50,50) 60 dBu contour of the KMDG Licensed Main Facilities.

It should be noted that Millcreek Broadcasting is concurrently filing a separate Application for Construction Permit for co-owned KMXU FM Manti, Utah, to use this transmitter site for its own auxiliary facilities. The two stations will combine into an ERI

8 bay SHPX antenna to provide service in the event of a transmission system failure at that station's Main Facilities. Besides this application for the KMDG AUX and the separate application for the KMXU AUX, there are no other proposed or authorized FM or TV transmitters, nor any non-broadcast radio antennas within 60 meters of the proposed antenna. There are no proposed FM or TV transmitters that may produce receiver induced intermodulation interference within ten kilometers of the proposed transmitting antenna. There are no AM facilities within 3.2 kilometers of the proposed tower site.

The distance to the blanketing (115 dBu) contour is calculated at 0.39 kilometers from the transmitter site. No interference is expected, as the proposed transmitting site is located in a rural area. Of course, the applicant recognizes its responsibility to resolve complaints of interference, including blanketing and receiver-induced interference as required by Sections 73.315 (b), 73.316(e), and 73.318 of the Commission's Rules.

Antenna and Supporting Structure

A sketch showing the proposed antenna and supporting structure is shown in Exhibit E, Figure 5. This tower is an existing structure with an Antenna Structure Registration Number (ASRN) of 1210829.

Human Exposure to Radiofrequency Radiation

The proposed FM Facility has been evaluated in terms of potential radiofrequency electromagnetic field exposure at ground level in accordance with OET Bulletin No. 65, Evaluating Compliance with FCC Specified Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields (OET Bulletin 65, Second Edition 97-01, August, 1997). The Commissions FM Model Power Density Prediction program was employed to determine the Field. The proposed center of radiation is 128 meters above ground level with an ERP of 1.0 kW (Horizontal and Vertical) using a ERI SHPX Series antenna with 8 elements, full wave spaced between elements. According to this study, the power density 2 meters above ground at the base of the tower will be .00013 mW/cm² and would not exceed the Uncontrolled Standard of .2 mW/cm². The highest predicted power

density 2 meters above ground would occur 38 meters away from the base of the tower. Here, the predicted power density would still comply as it would be .00025 mW/cm² or 0.13% of the Uncontrolled Standard. The combined transmission system of the proposed KMDG AUX and the separately proposed KMXU AUX facilities would continue to easily comply with the Uncontrolled Standard with a highest predicted power density of .0005 mW/cm², or 0.25% of the Uncontrolled Standard, occurring 38 meters from the base of the tower.

Even though the site will fully comply with the Uncontrolled Site Standards, access to the transmitting site will be restricted and appropriately marked with warning signs. When it becomes necessary for workers to ascend the tower, appropriate measures, such as reduction or shut down of power if necessary, shall be taken to ensure that the human exposure to radiofrequency radiation will not exceed the FCC guidelines.

Environmental Impact

The proposal would not be subject to environmental processing in accordance with Section 1.1306. The proposed construction would not constitute a major action as defined in the Commission's Rules and Regulations. During operation, the facility will produce no chemical or significant thermal pollution, and no ionizing radiation will be generated. Areas of high intensity radiofrequency fields will be confined to the immediate area of the transmitting antenna, far above the ground and away from any human and wildlife protection. The area is not officially designated as a wilderness area or wildlife preserve and is not pending consideration. The area has no significant value in American history, architecture, archaeology, or culture, which is listed in the Register of Historic Places, and it is not eligible for listing. It is not recognized either nationally or locally for special scenic or recreational value.

Conclusion

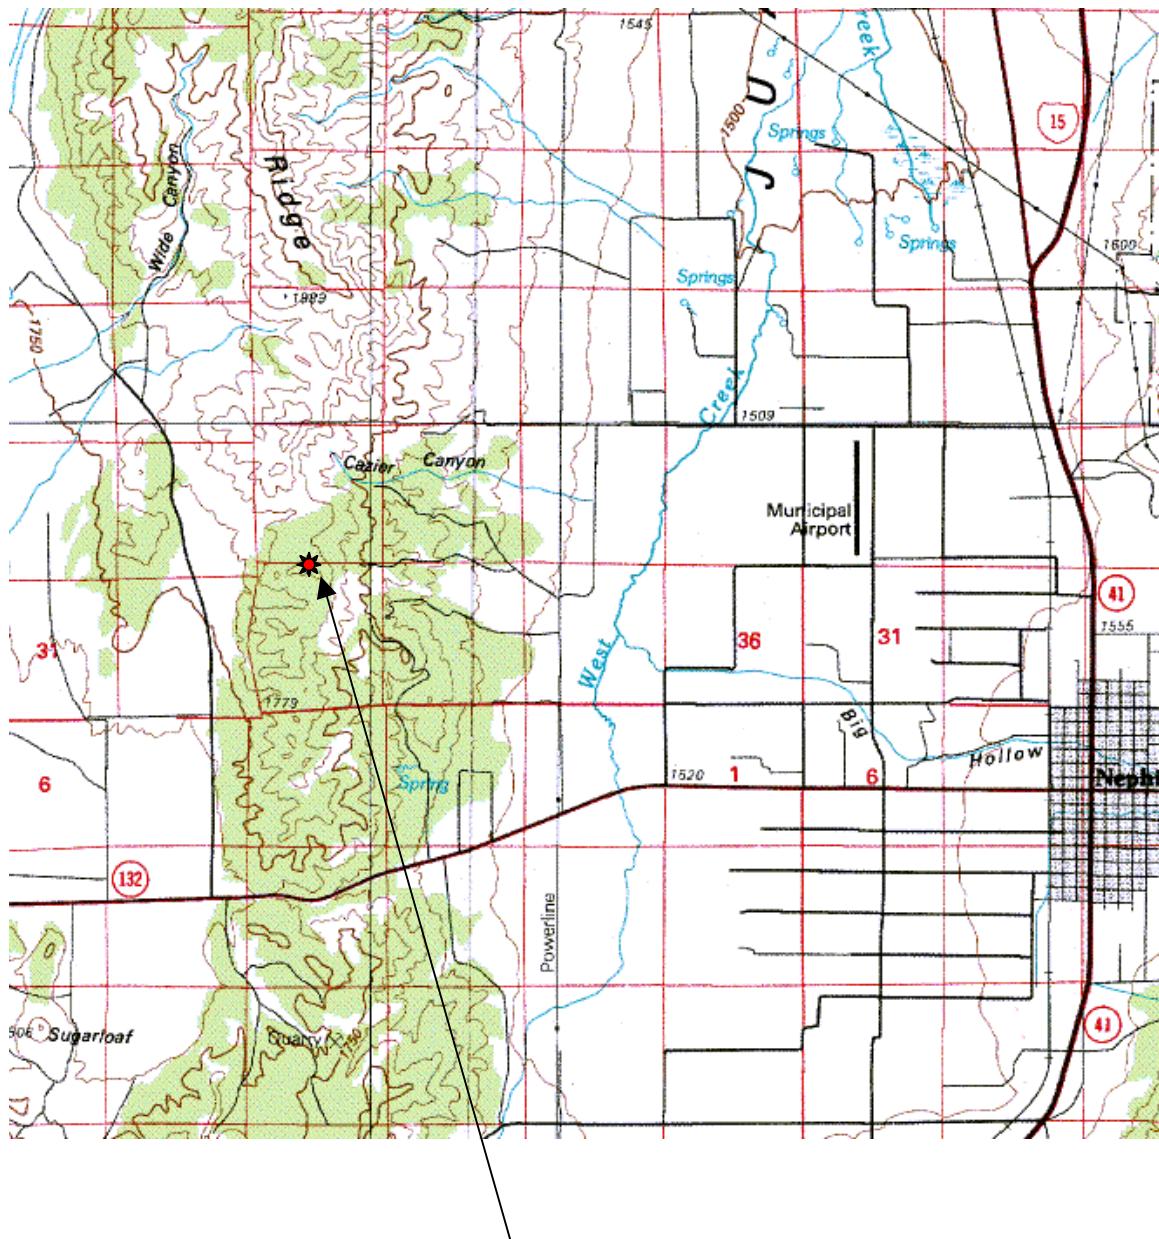

This statement/application has been prepared for The Applicant by utilizing the latest available information, cross-checked with the Federal Communications Commission and

other sources. Therefore, it is submitted that the proposed is in compliance with the Commission's Rules and Regulations and other sources. Therefore, it is submitted that the engineering data complied and demonstrated herein for the proposed is in compliance with Commission's Rules and Regulations at the time of the application's filing date. I welcome the opportunity to discuss with the staff of the Federal Communications Commission the engineering data contained in this application. Should any questions arise concerning the information, please contact the undersigned. The following pages are exhibits prepared and assembled in support of the proposed:

Average Elevation = 1743.15 M

HAAT= 300.85 M

AMSL= 2044 M

Area by numeric integration= 3086.30 Sq km.

Vertical Plane Sketch of Supporting Structure
(Not to Scale)

KMDG FM Nephi, Utah
Facility Number 72769
Proposed Location: N39-43-58, W111-56-34
Proposed Antenna: 8 element
ASRN: 1210829
