**ANTENNA DESCRIPTION**

A custom designed FMECD/1-DA antenna was fabricated to conform to the prescribed directional azimuth pattern. The antenna consists of one (1) circularly polarized, cross-V dipole radiating element mounted to a fifty-four (54)" (inch) face tower. The antenna array points 267 degrees true north.

**DESCRIPTION OF TEST PROCEDURE**

The test antenna consisted of a single third-scale bay. The antenna was mounted to a third-scale pipe, which was mounted to a third-scale tower by use of third-scale brackets identical to those shipped with the final, full-scale antenna. For testing, the entire third-scale model was then mounted atop a 20' (foot) high platform, and all feed cables were properly grounded. Horizontal and vertical readings were taken. The desired directional pattern was obtained by adjusting the distance between the tower and the antenna, and modifying the direction of the azimuth heading. A parasitic element was added for performance enhancement.

**DESCRIPTION OF TEST PARAMETERS AND EQUIPMENT**

Horizontal and vertical pattern readings were taken by mounting a source antenna - a vertical/horizontal dipole, Cavity Back Resonator (CBR) antenna bay - approximately 100' (feet) from the third-scale antenna model. The source antenna's height was adjusted to achieve a uniform field at the third-scale test antenna location. The CBR antenna was operated in receive mode, at frequency 267.9 MHz. The third-scale test antenna was then rotated clockwise in order to achieve 360° (degree) pattern readings. A gain reference was taken using a dipole tuned to 267.9 MHz. Nowhere did the received signal, or resultant documentation, exceed a maximum to minimum ratio of 15dB (decibels).

## TEST RESULTS

The attached calculations verify that the RMS value of this antenna is 88.4% of the RMS value of the pattern authorized in the related FCC file BPED-20150318AAS. The vertical component RMS value is 0.653. The horizontal component RMS value is 0.604. The circular polarized component RMS value is 0.769.

Azimuth and elevation plots and associated tabulations of this antenna are included with this package.

Measured vertical polarized directivity:	2.345 / 3.70 dB
Measured horizontal polarized directivity:	2.745 / 4.39 dB
Measured circular polarized pattern directivity:	1.693 / 2.29 dB

Gain in each polarization was calculated using the following relation:

$$\text{GAIN} = \text{Azimuth Directivity} \times \text{Power Ratio Between Polarizations} \times \text{Elevation Directivity}$$

Using this relationship along with ratio measured at our testing facilities:

$$\begin{aligned} \text{V-Pol. Gain} &= (2.34460)(.5394)(0.883) = 1.117 / 0.479 \text{ dB} \\ \text{H-Pol. Gain} &= (2.74535)(.4606)(0.883) = 1.117 / 0.479 \text{ dB} \end{aligned}$$

## INSTALLATION AND MOUNTING

The antenna is to be mounted in accordance with the supplied drawings. The antenna center of radiation is to be 34 meters (111.55 ft.) above ground level. The antenna aperture is 0.0 feet. No other antennas are to be mounted within 10 feet of the antenna. No other obstructions other than those specified by original drawings supplied are to be mounted at the same level as the antenna. The antenna is to be oriented 267 degrees true North.

The system's orientation and the mounting details are described in the following drawings:

DRAWING NO.	TITLE
1975D00	ELEVATION
1975D01	ANTENNA ORIENTATION
2105A10	TEST RANGE SCHEMATIC

The array shall be mounted according to all details outlined in DWG. 1975D00. The antenna elements shall be aligned at the same heading as in DWG. 1975D01. This will ensure that the antenna is oriented properly at 267 degrees true north. The test range schematic DWG. 2105A10 shows the mounting configuration of the antenna setup on our range.
