

The proposed project will not create or precipitate any identifiable long term changes in the diversity of animal species, the population density of any animal species, or change the behavior patterns of any animal population.

The proposal will not utilize any unusually fragile environmental area. The existing tower has not required any changes to the contour of the surface land nor have any changes occurred to surface water turbidity. The proposed project will not cause or precipitate any identifiable long term changes in the diversity of plant species, or in the population density of an individual native species of plants.

In summary, the proposal will have no special environmental significance. There should be no further effect on scenic, cultural, historic, architectural, archeological, or recreational uses of surrounding lands, beyond that now being experienced. There will be no deforestation, water diversion, wetland fill, or other extensive change of surface features. The proposal will not create, directly or indirectly, a permanent environmental change to animals, plants, land, or humans.
