Declaration

I declare, under penalty of perjury, that I am a technical consultant to broadcasting and other communications systems, that I have over twenty-five years of experience in the engineering of broadcast and other communications systems, that I am familiar with the Federal Communications Commission's Rules found in the Code of Federal Regulations Title 47, that I am a Professional Engineer registered in North Carolina, that I have prepared or supervised the preparation of the attached Exhibit 13, Interference Analysis, for Wake Forest University, and that all of the facts therein, except for facts of which the Federal Communications Commission may take official notice, are true to the best of my knowledge and belief.

Narrative

This Exhibit supports a long form application for CDBS application ID 1564617, an amended “Tech Box” application in response to a filing window¹ for FM translator file number BNPFT-20030317FRQ, CDBS application ID 649140, on Channel 233 in Boone, North Carolina. Allocation details are provided in this exhibit. The application proposes new technical parameters. Specifically, this application proposes decreased elevation, and reduced power. The directional antenna pattern has been updated by the manufacturer. Because there are changes, a new preclusion showing is provided.

This proposal creates no new mutual exclusivities with any Auction 83 Tech Box filings or any other facility.

Figure 1 shows the proposed 60 dBu F(50,50) coverage area. The primary station WXIT (AM) 2 mV/m contour and 25 mile radius circle are also shown.

Allocations

This application proposes service to Boone, North Carolina, on channel 233. An updated Table 1: Allocations is included in this exhibit with a list of the stations, construction permits, allocations, and applications studied. All are protected by this application, with the exception of facilities which are listed in Table 2 below. Those facilities are protected by the Desired to Undesired (D/U) Ratio method which is described below. Where the outgoing protection is provided by interference contours with a separation of less than 3.2 kilometers (2

¹ *Public Notice, Media Bureau Announces FM Translator Auction 83 Filing Window and Filing Procedures, August 30, 2013 Deadline Set for Form 349 Applications for Certain Non-Mutually Exclusive Tech Box Proposals*, Report No. AUC-03-83-E, DA13-1675, released July 31, 2013.

miles), the lack of overlap is plotted in figures in this exhibit, and the output of the FM Over program is provided. For this application, there is one (1) facility for which additional detail is provided.

Terrain database is NGDC 30 SEC, R= 73.215 qualifying spacings or FCC minimum spacings in KM, M= Margin in KM
 In & Out distances between contours are shown at closest points. Reference Zone= East Zone, Co to 3rd adj.
 All separation margins (if shown) include rounding
 Ant Column: (D= DA Standard, Z= DA 73.215, N= Not DA 73.215, _= Omni), Polarization (C,H,V,E), Beamtilt(Y,N,X)
 "*"affixed to 'IN' or 'OUT' values = site inside protected contour.

Table 2: Facilities Protected by U/D Method

Facility	WMEV-FM Marion, Virginia
Relationship	230 C, third adjacent
Distance (km)	75.33
Bearing (degrees)	10.9
ERP (kW, on azimuth)	100
HAAT (m, on azimuth)	483.0
Ratio	40
Signal Strength (dBu)	64.3
Translator Signal Strength	104.3
Translator distance (km)	.234

Undesired to Desired Method

Protection to some facilities is provided through the use of Undesired to Desired Signal Strength Ratio (U/D) calculations. Table 2 lists the parameters studied. The proposed antenna is a Scala YA7 two level antenna, with the elements offset, in the forward direction, by $\frac{1}{4}$ wavelength. The antenna harness is designed so that, in the forward direction, the antennas are in phase, while the rearward radiation is significantly reduced. The elevation pattern is shown in Figure 4. The elevation of the 104.3 dBu contour is shown in Figure 5. The horizontal plane pattern is shown in Figure 6 and the distance to the 104.3 dBu contour is plotted in Figure 7.

The WMEV-FM field strength calculated at ground level at the proposed 1564617 site is 64.3 dBu, using the FM Curves calculator on the FCC web site. For the translator interference contour, free space calculations are used. The corresponding 104.3 dBu field strength distance is .234 kilometers in the horizontal plane. The proposed antenna location is 10 meters above ground. As Figure 5 shows, the 104.3 dBu signal level reaches the ground level or below in the antenna forward direction for most of the maximum extent of than .234

kilometers. However, the horizontal plane pattern results in the interference signal not reaching any occupied locations. Figure 7 is a horizontal plane plot of the distance to the 104.3 dBu contour, calculated using free space equations.

There are five (5) structures within distance of the proposed site which are studied further. Elevation differences are not significant. The sites are numbered clockwise from the West. The distances are shown on the topographic site map and aerial photograph.

Site	Bearing (degrees)	Distance (meters)	Relative Field	ERP (Watts)	104.3 dBu (meters)	Margin (meters)
1	281	193	0.632	11.98	148.00	45
2	302	182	0.247	1.83	58	124
3	53	128	0.01	0.00	2	126
4	84	155	0.01	0.00	2	153
5	112	269	0.028	0.02	7	262

Figure 8 is a topographic map of the transmitter site, showing that the site is on a mountain ridge. Figure 9 is an aerial photograph of the site, showing the absence of large structures in the area of interest. Figures 8 and 9 have lines distances to the nearest structures. As tabulated above, the structures are all well beyond the predicted interference signal contour. There is no population within the predicted interference area and therefore this facility is permitted under §74.1204(d).

The applicant recognizes that the U/D method is only a tool for predicting likely interference. Should any actual interference be experienced, the applicant will cooperate fully in correcting the interference. Corrective steps may require changes in the transmitting antenna or other steps which would require Commission authorization, may require that the translator cease operation except for brief equipment tests, or may require filtering at the receivers which report interference.

Source of Data

Transmitter location, effective radiated power, directional antenna pattern, and elevation data are extracted from the Commission's CDBS. All contours for existing and proposed facilities are calculated using height above average terrain calculated at one degree horizontal increments.

The contours were evaluated using terrain extracted from the NGDC 30 second terrain database, formatted for use with V-Soft allocation and propagation software.

All population data is from 2010 U.S. Census PL data files. Population is counted by considering the location of the centroid of each census block. The data for each block is counted if it falls within the area being counted.
