

The applicant is presently authorized to operate the reference facility at a site near Palermo, California. Having been displaced by co-channel BT KTSF-DT, San Francisco, California, it is now proposed to relocate the station to an existing tower site slightly south of Oroville, California, at the same time changing to Channel 4+. Overlap of the authorized and proposed service contours is shown on the attached Exhibit 6A.

A review of all available records indicates that interference is predicted with regard to various authorizations or allocations. In this instance, the attached allocations study of Exhibit 6B shows--with one exception--that population loss to any of these per O.E.T. Bulletin No. 69 procedures would be less than 0.5% and appropriate waivers are requested. In the case of TT K04FL, the attached Exhibit 6C demonstrates compliance with the provisions of 47 CFR 74.707(d).
