APPLICATION FOR LICENSE

The following engineering statement and attached exhibits have been prepared for **Community Broadcasting, Inc.** ("CBI"), licensee of non-commercial educational FM station KSIV-FM at St. Louis, Missouri, and are in support of their application for license.¹ This application pertains to the KSIV-FM auxiliary facility, and is being filed to cover modification to that facility authorized under FCC File No. BXPED-20120314AAI.

Under that application, a correction to the geographic coordinates of the tower and the elevation of the center of radiation were requested. The change in parameters associated with the main KSIV-FM facility was requested under separate applications, and are licensed.² The auxiliary facility proposed under the above referenced file number made no change to the effective radiated power, however, the center of radiation changed due to a surveyed determination of the site elevation above mean sea level. No actual physical changes were made under the application; rather the sole purpose was to bring the technical parameters of the facility into agreement with reality.

The auxiliary facility is authorized with an effective radiated power of 17 kW at a center of radiation of 183 meters above ground. This value corresponds to a center of radiation of 320 meters above mean sea level, and 167 meters above average terrain. The facility continues to utilize the Electronics Research, Inc. (ERI) LPX-4C antenna specified in the original auxiliary facility.³ This is a non-directional antenna employing no electrical or mechanical beamtilt.

¹ The Facility ID for KSIV-FM at St. Louis, Missouri is 4276.

² See FCC File Nos. BPED-20120309AAS and BLED-20120626ABO.

³ See FCC File Nos. BXPED-20060627ACG and BXLED-20070201BPZ.

The main studio for the facility complies with the provisions of Section 73.1125 of the Commission's Rules. The main studio for KSIV-FM is located at 1750 S. Brentwood Blvd. This location is outside of the corporate limits of the independent city of St. Louis, but is located within the predicted 70 dBu service contour of both the main and auxiliary KSIV-FM facilities as is demonstrated in Exhibit E-1.

The specified transmitter power achieves the authorized effective radiated power. The antenna utilized by the facility, ERI model LPX-4C, has a power gain of 2.133. The input power to the antenna to achieve the authorized effective radiated power is 7.97 kW.

The transmission line system feeding the antenna consists of two sections. The first section is a 780-foot length of Andrew LDF7-50A foam-dielectric semi-flexible coaxial cable with a nominal diameter of 1 5/8 inches. This section of line has an efficiency of 69.96 percent based on data from the manufacturer. The input power to this section to achieve the authorized effective radiated power is 11.39 kW.

The second portion of the transmission line run consists of 40 feet of Myat 201 rigid transmission line with a nominal diameter of 1 5/8" inches. The efficiency of this portion of the run is 98.34 percent. The input power to this section, which is at the output of the transmitter, to achieve the authorized effective radiated power is 11.58 kW. This value rounds to 11.6 kW, which is the specified transmitter power output for the facility.

The construction permit as issued by the Commission lists four (4) special conditions or restrictions. CBI is in compliance with these conditions. Each condition will be individually discussed.

The first restriction pertains to automatic program test authority for the KSIV-FM auxiliary facility. Under this condition, CBI is advised that program test authority must be requested for the facility. This application therefore formally requests program test authority for the facility.

The second condition, which relates to the first condition, requires the performance of radiofrequency electromagnetic field strength measurements throughout the site to ensure that no areas exceed the human guidelines for exposure to RF fields. The required measurements were performed on December 12, 2014, and the results of these measurements are contained in this technical exhibit.

Measurements were performed through the use of a Narda SRM-3006 selective radiation meter. This equipment allows for the identification of the individual contributors to an aggregate power density measurement at a particular location. Each of the media bureau licensed facilities at the Mackenzie Road site were identified, and a service table with each of their frequencies and callsigns created for the purpose of these measurements. All other facilities not specifically identified were still measured, but are contained in the "others" section.

JEREMY RUCK & ASSOCIATES, INC.

P.O. Box 415

jeremyruck.com

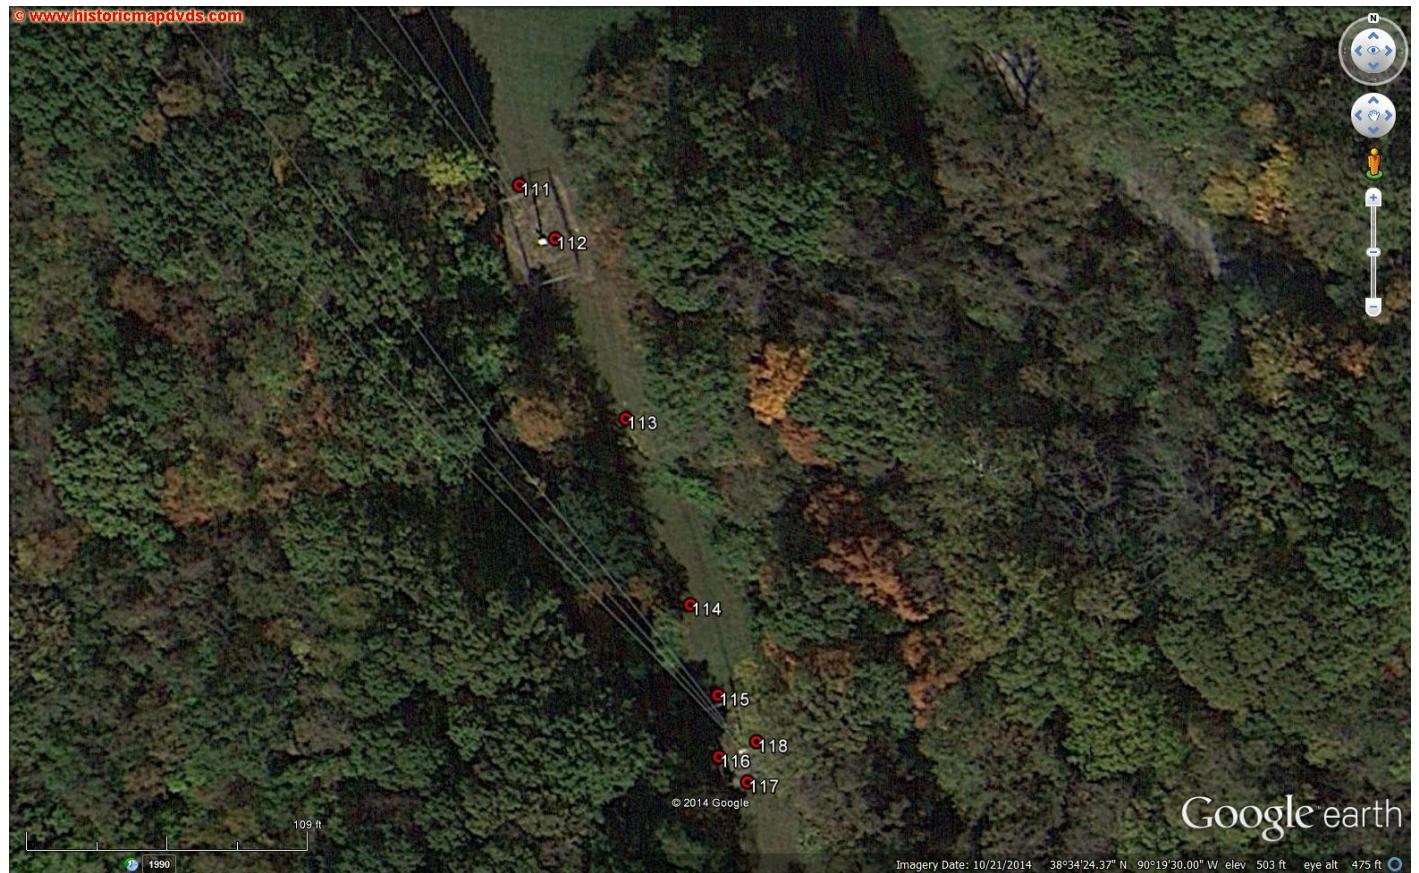

The measured data follows this engineering statement. At each measurement location an "Index" number has been assigned. These index numbers, denoted on each of the measurements correspond to the locations in the following two satellite photographs.

JEREMY RUCK & ASSOCIATES, INC.

P.O. Box 415
221 S. 1st Avenue
Canton, IL 61520

Tel: 309.647.1200
Fax: 855.332.9537
jeremyruck.com

The first of these two photographs illustrates the measurement locations within the main fenced area at the site. The second illustrates additional measurements that were made in the vicinity of the southern guy wires at the site. These measurements, indicated by index numbers 111 through 117 are representative of similar measurements that would be made along the other two guy radii.

These measurements demonstrate that the aggregate power density at the site is generally less than five percent of the general population environment of the Commission's safety standard. Measurements in the immediate vicinity of the outer guy point are substantially greater, however, these areas, except in extremely close proximity to the actual guy point do not exceed the general population exposure standard. The areas near the guy points are fenced, as indicated by the satellite imagery, and are locked to prevent casual access. Appropriate signage is present in the

immediate vicinity of these areas, which because of their nature function as controlled environments.

It should be noted that in these areas immediately adjacent to the outer guy point where the measured power density is the greatest, the major contributors to the aggregate power density do not include the KSIV-FM auxiliary facility, which was operational for the purposes of this test. Rather, the major contributors were the facilities utilizing the community antenna located at the top of the tower.

Under the third special condition, CBI is advised that documentation demonstrating compliance with the second special condition shall be submitted at the time of the FCC Form 302 submission. This engineering statement and the attached power density measurements serve as the required documentation under this special condition.

The fourth and final special condition requires CBI to coordinate with all other users of the site to ensure that workers and other personnel are not exposed to levels of radiofrequency radiation in excess of the applicable safety standards. CBI certifies that it will coordinate with all other users of the site to prevent such exposure. Coordination activities will include, but are not necessarily limited to, a reduction in transmitter power or cessation of operation.
