Declaration

I declare, under penalty of perjury, that I am a technical consultant to broadcasting and other communications systems, that I have over twenty-five years of experience in the engineering of broadcast and other communications systems, that I am familiar with the Federal Communications Commission's Rules found in the Code of Federal Regulations Title 47, that I am a Professional Engineer registered in North Carolina, that I have prepared or supervised the preparation of the attached Exhibit 13, Interference Analysis, for Foothills Media, Inc., and that all of the facts therein, except for facts of which the Federal Communications Commission may take official notice, are true to the best of my knowledge and belief.

Narrative

This Exhibit supports a minor modification application for FM translator construction permit W278CZ, on Channel 278 in Elkin, North Carolina. Allocation details are provided in this exhibit. This proposal complies fully with the requirements of 74 C.F.R. §74.1204(a), with the exception of facilities protected under 47 C.F.R. §74.1204(d) by the Undesired to Desired (U/D) method described below. The proposed modified facilities create no mutual exclusivities with any licensed facilities, construction permits, or applications as shown in the allocation table in this exhibit.

The changes are a new site, an increase in height, and a new omnidirectional antenna, with three quarter wavelength spacing.

Figure 1 shows the authorized and protected contours, and fill-in compliance.

Allocations

This application proposes service to Elkin, North Carolina, on channel 278. An updated Table 1: Allocations is included in this exhibit with a list of the stations, construction permits, allocations, and applications studied. All are protected under §74.1204(a) contour protection by this application, with the exception of facilities protected by the Undesired to Desired (U/D) method. Facilities protected by the U/D method are listed in Table 2. The allocations table was prepared using the NED 03 Arcsecond terrain database which is described below. Where the outgoing protection is provided by interference contours with a separation of less than 3.2 kilometers (2 miles), the lack of overlap is plotted in figures in this

exhibit, and the output of the FM Over program is provided. For this application, there is one (1) facility for which additional detail is provided.

Terrain database is NED 03 SEC, R= 73.215 qualifying spacings or FCC minimum spacings in KM, M= Margin in KM
 In & Out distances between contours are shown at closest points. Reference Zone= East Zone, Co to 3rd adj.
 All separation margins (if shown) include rounding. Call signs with exclamation marks need not be protected.
 Ant Column: (D= DA Standard, Z= DA 73.215, N= Not DA 73.215, _= Omni), Polarization (C,H,V,E), Beamtilt(Y,N,X)
 **affixed to 'IN' or 'OUT' values = site inside restricted contour.

Table 2: Facilities Protected by U/D Method

Facility	WTQR Winston-Salem, North Carolina
Relationship	281C, third adjacent
Distance (km)	52.61
Bearing (degrees)	74.5
ERP (kW, on azimuth)	100.0
HAAT (m, on azimuth)	524.4
Ratio	40
Signal Strength (dBu)	74.85
Translator Signal Strength	114.85
Translator distance (km)	.201

Undesired to Desired Method under §74.1204(d)

Protection to some facilities is provided through the use of Undesired to Desired Signal Strength Ratio (U/D) calculations. Table 2 lists the parameters studied. The proposed antenna is an SWR FMEC/2-75 two level directional antenna array with bay spacing of 0.75 wavelength, as designed by the manufacturer. The elevation pattern is shown in Figure 4. The elevation of the 114.85 dBu contour is shown in Figure 5.

The WTQR field strength calculated at ground level at the proposed W278CZ site is 74.85 dBu, using the FM Curves calculator on the FCC web site. For the translator interference contour, free space calculations are used. The corresponding 114.85 dBu field strength distance is .201 kilometers in the horizontal plane. The proposed antenna location is 49 meters above ground. As Figure 6 shows, the 114.85 dBu signal level does not reach ground level. The lowest elevation is 4 meters (13 feet) above ground.

Figure 6 is a topographic map of the transmitter site, showing that the site is on a minor ridge in gently rolling terrain. Figure 7 is a Google Earth aerial photograph with a 114.85 dBu field strength line plotted. There are a few structures within the contour, but

mostly on lower terrain and well below the interference contour elevation as shown in Figure 5. Two unoccupied storage sheds are located on the same elevation as the base of the tower. The distances to those sheds and their roof levels are plotted on Figure 5. The only area with a higher elevation than the base of the structure is a portion of a field South Southeast of the structure. There is no population within the predicted interference area and therefore this facility is permitted under §74.1204(d).

The applicant recognizes that the U/D method is only a tool for predicting likely interference. Should any actual interference be experienced, the applicant will cooperate fully in correcting the interference. Corrective steps may require changes in the transmitting antenna or other steps which would require Commission authorization, may require that the translator cease operation except for brief equipment tests, or may require filtering at the receivers which report interference.

Source of Data

Transmitter location, effective radiated power, directional antenna pattern, and elevation data are extracted from the Commission's CDBS. All contours for existing and proposed facilities are calculated using height above average terrain calculated at one degree horizontal increments.

The contours were evaluated using terrain extracted from the National Elevation Dataset (NED) 03 terrain database. The NED 03 database is derived from the USGS National Elevation Dataset 30 meter terrain database. The USGS National Elevation Dataset has been developed by merging the highest-resolution, best-quality elevation data available across the United States into a seamless raster format. NED is the result of the maturation of the USGS

effort to provide 1:24,000-scale Digital Elevation Model (DEM) data for the conterminous US and 1:63,360-scale DEM data for Alaska.
