

Exhibit E-30

The proposed facility should be exempt from environmental processing as it would be located on an existing tower, for which there would be no additional environmental impact, and would not constitute an RF radiation hazard to persons at the site. The tower on which the antenna would be located is registered with the Commission.

There are no other broadcast facilities that would be located at this structure. The proposed facility would utilize a single bay ERI style roto-tiller antenna located at 25.0 meters above ground level. As indicated on the form pages, the effective radiated power for the facility would be 0.225 kilowatts. Based on these parameters, the Commission's FM Model software package indicates that the predicted power density at ground level would be $6.31 \mu\text{W}/\text{cm}^2$. This maximum would be located at a distance of 22 meters from the tower base.

Since the predicted power density at ground level would not exceed the uncontrolled environment limit it is respectfully submitted that the proposed facility would not constitute an RF exposure hazard to persons at the site.
