

**W295AP
APPLICATION FOR MINOR CHANGE
FILED IN A QUEUE BEHIND W293BA APPLICATION**

This technical report has been developed in support of an application for a minor modification to FM translator W295AP requesting a change in site. The translator will serve as a fill in for AM station WRNE at Gulf Breeze, FL (facility ID#410010).

Allocation exhibits are provided as required by FCC form 349 as follows:

- E1 Interference channel study**
- E1A Interference plot to WRGV and W293BA application**
- E1B Aerial photograph of interference area**
- E1C Antenna horizontal and vertical patterns**
- E2 Service contour plots**
- E3 ASR**

Exhibit E1 demonstrates clearance to all facilities with the exception of 2nd adjacent channel station WRGV and translator application W293BA. Exhibit E2 shows that the proposed 60 dBu contour is contained within the AM station's 2 mV/m and 40 km radius, and that it overlaps the 60 dBu of the W295AP as constructed CP for which a form 350 has been filed. The FCC 30 second terrain database provided by V-Soft Communications has been used throughout this study.

The proposed W295AP facility will be located inside the protected contours of second adjacent channel station WRGV and translator application W293BA. Therefore, an interference analysis has been conducted based on the D/U ratio of +40 dB at the proposed site. The WRGV contour at that site is 78.5 dBu and the W293BA contour is 69 dBu. The lower contour has been studied based on the +40 dBu interference ratio. That interfering contour is 109 dBu or 393.5 meters. When the depression angle of 13.4 degrees based on the mounting height of 94 meters AGL is considered the ERP reduces to 0.163 kW yielding an interfering 109 dBu (50,10) contour of 317.7 meters..

This interference contour has been evaluated at 13 degrees and at subsequent five degree increments to establish the vertical clearance from the interfering contour to ground level. The minimum clearance tabulated below is 39 feet or 11.9 meters which is more than sufficient to clear the single story industrial buildings and other two story buildings identified in the aerial

photograph included as exhibit E1B. Based on this showing that the interfering contour will not reach a populated area, a waiver of Section 74.1204 is requested.

Vertical clearance is demonstrated in the following table.

Depression Angle (Degree)	F	ERP X F² kW	109 dBu meters	Vertical Clearance to ground (meters)
13.4	0.808	0.163	317.7	20.4
15	0.764	0.146	300.7	16.2
20	0.611	0.093	240.0	11.9
25	0.447	0.050	176.0	19.6
30	0.288	0.021	114.0	37.0
35	0.147	0.0054	57.8	60.8
40	0.033	0.0003	13.6	85.3
45	0.050	0.0006	19.3	80.4
50	0.104	0.0003	13.6	85.3
55	0.131	0.0043	51.6	51.7
60	0.138	0.0048	54.5	46.8
65	0.129	0.0042	51.0	47.8
70	0.110	0.0030	43.1	53.5
75	0.085	0.0020	35.2	60.0
80	0.058	0.0008	22.3	72.0
85	0.029	0.0002	11.1	82.9
90	0.001	0.0000	00.0	00.0

Depression angle is angle below radiation center.

F = vertical elevation factor at depression angle.

Vertical clearance is calculated by multiplying the interference contour X the sine of the depression angles – the radiation center height above ground level.

It is recognized that co-pending translator applications may not receive interference. Therefore, it is respectfully requested that the W295AP application be held in a queue behind the W293BA application until it is granted. At that point, the W295AP application may receive interference from W293BA and it has been demonstrated that the W295AP application will not cause interference to W293BA.

Proposed site, antenna and RF calculation:

The proposed facility will utilize a PSI three bay half wave spaced directional antenna. The RF contribution for the proposed facility at ASR#1066042 has been calculated to be 0.038 μ Watts/cm² using the formula provided below and a vertical factor of 0.138 at 60 degrees

depression angle. This is 0.02% of the maximum permissible 200 micro-Watts/cm² exposure for general population/uncontrolled exposure and less than the 5% of that level that is excluded from consideration.

$$S \text{ (RF in } \mu\text{Watts/cm}^2\text{)} = \frac{33.4 (F^2 - \text{Vert Factor}) \times (H \text{ ERP} + V \text{ ERP in Watts)}}{R^2 \text{ (distance to radiation center in meters} - 2 \text{ meters)}}$$
