

Technical Statement
Application for Construction Permit
W256BI Red Hook , NY
June, 2009

This technical statement is prepared by Charles Williamson, president of Digital Radio Engineering, Inc., for WillPower Radio, LLC, licensee of W256BI at Red Hook, NY. This application proposes to change output channel.

An allocation for a Class A facility on channel 255 at Rosendale, New York was recently settled within Auction 88. The winning bidder has filed his application for Construction Permit, and as such, it is noted there will be interference with regard to W256BI operating on a first adjacent channel within the service contour of the Rosendale facility. Subsequently, this translator facility is considered displaced.

An allocation study was performed looking at each channel plus and minus there channels. There is no channel that works due to the subject Rosendale facility and other nearby facilities. Channel 290 was identified as a clean channel that would not result in any interference or require any waiver requests.

This facility remains a fill-in translator for WKZE-FM. As such, power does not exceed 250 watts. The antenna type and location remains the same. The service contour of the proposed translator facility is consistent with the presently licensed facility and is fully contained within the service contour of WKZE-FM.
