

Exhibit Demonstrating Compliance with Section 73.317

The spectral measurements shown below were taken by Mr. Ernie Nearman of Broadcast Resources Co. on behalf of Salem Media of Hawaii, Inc., on June 7, 2017 using a Rigol DSA815-TG spectrum analyzer with current calibration. The measurements were made with recently authorized stations K232FL (94.3 MHz) and K236CR (95.1 MHz) simultaneously using the new shared antenna while operating at their full authorized power levels.

The occupied bandwidth measurements shown in Figure 1 demonstrate that the K236CR (95.1 MHz) emissions satisfy the attenuation requirements of Section 73.317(b) and Section 73.317(c) of the FCC Rules. Note the 94.7 MHz carrier (KUMU) and the 95.5 MHz carrier (KAIM) are attributable to local FM radio stations.

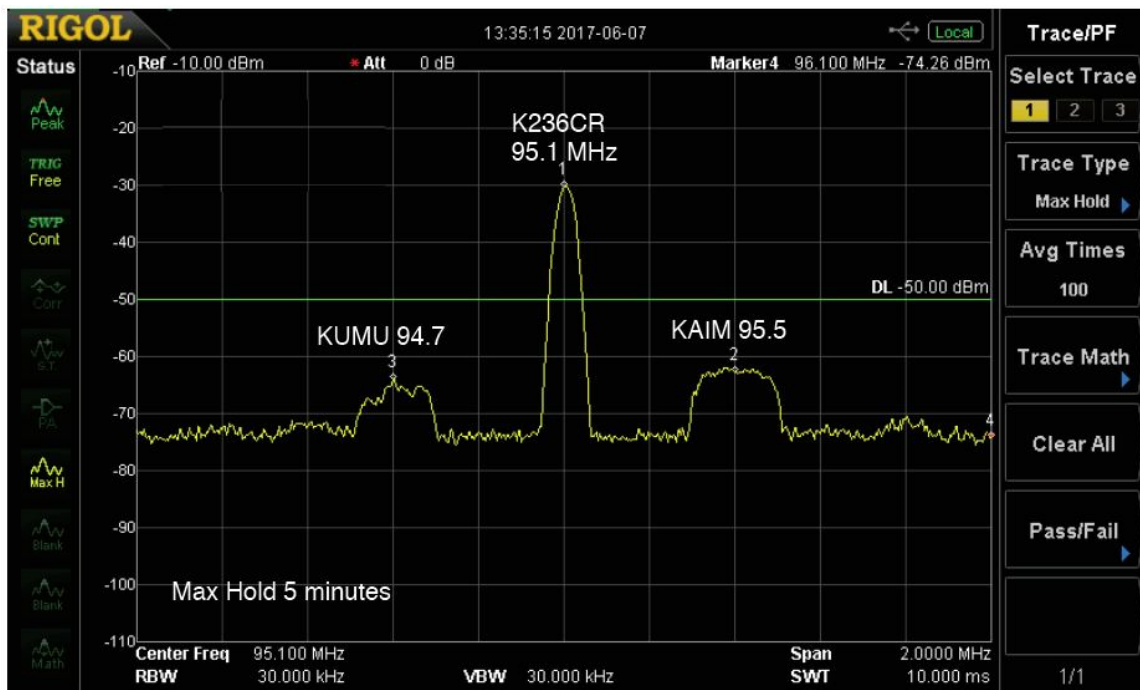

Figure 1. Section 73.317(b) and (c) occupied bandwidth measurements.

Spectral measurements were also performed to verify compliance with out-of-band emission requirements of Section 73.317(d). As Figure 2 shows, the measurements are sufficiently below the main carrier level to satisfy the requirements of Section 73.317 of the FCC Rules. Any peak measurements on Figure 2 which are above the -95.23 dBm level (i.e. less than 66.98 dB below the -28.25 reference level) were determined to be within the noise floor or are attributable to operating FM stations and are not an out-of-band emission from K236CR.

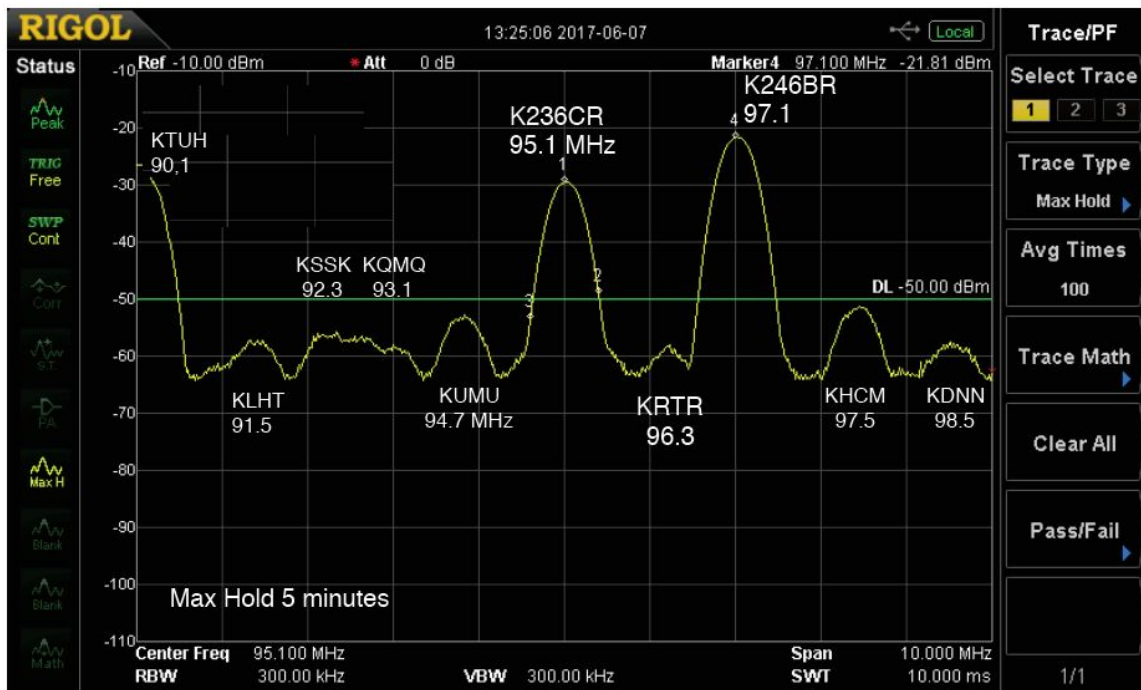

Figure 2. *Out-of-band spectrum measurements.*
