

Engineering Exhibit RF Radiation Compliance Statement

The transmitting facilities authorized in construction permit BMXPH-20080903AAF are located at a site commonly known as the Lower Commanche Peak Communications Site. The Lower Commanche Peak Communications Site is a multi-user communications site. The site is located on a rugged mountaintop within the Franklin Mountain range near El Paso, TX.

On October 22, 2008 RF exposure measurements were conducted by members of the KPRR (FM) engineering staff in and around the Lower Commanche Peak Communications Site while KPRR (FM) was operated as authorized in the construction permit. The measurements were made using a NARDA 8718B EM Survey meter (SN#1532 cal 1/08) utilizing an A8742D Shaped E Field Probe (SN#12010 cal 1/08). The A8742D is a shaped probe corresponding to the 1997 FCC Occupational/Controlled Standard with usable response from 300 kHz – 3 GHz providing a reading of the electric field component in percentage of the plane wave equivalent power density corresponding to the 1997 FCC Occupational/Controlled Exposure Standard. Measurements were made using the “Max Hold” function of the NARDA 8718B meter while slowly walking a survey grid around the site sweeping the meter probe up and down and side to side in an oscillatory fashion covering as much volume of space as practical. In areas where the indicated RF exposure levels approached or exceeded 100%, spatially averaged measurements were made utilizing the spatial averaging functionality built into the NARDA 8718B.

The site is serviced via a single access road blocked at the base of the mountain by a securely locked gate. Casual access to the site is limited by a combination of the locked gate, fencing and intervening steep, hazardous terrain. No locations outside the secured area were identified where any significant RF exposure levels could be detected with the instrumentation used.

The maximum spatially averaged RF exposure level measured at ground level within the secured area was 37% the 1997 FCC Occupational/Controlled Exposure limit. This maximum occurred just north of the transmitter building along the access road. Thus, KPRR (FM), when operated as permitted by BMXPH-20080903AAF complies with OET Bulletin 65 Edition 97-01 with regard to the General Population/Uncontrolled Exposure and Occupational/Controlled Exposure.

KPRR (FM), in cooperation with other licensees, will reduce power or cease operations as necessary to protect persons having access to the site, including the tower or antennas, from RF exposure in excess of FCC guidelines.
